이더넷 관리 정보 베이스(MIB) 정의 (IEEE802.3.1-2011)

Management Information Base (MIB) Definitions for Ethernet

서 문

1. 표준의 목적

본 표준은 네트워크 관리 프로토콜을 사용하여 IEEE 802.3 표준 (이더넷) 기반의 장치를 제어하고, 감시하기 위한 계층적 관리 객체들의 집합인 이더넷 관리 정보 베이스 모듈에 대한 제반 사항을 제공한다.

2. 주요 내용 요약

본 표준은 IETF 에서 이미 정의한 관리 정보 구조 버전 2 (SMIv2; Structure of Management Information Version 2) MIB 모듈 규격과 IEEE 802.3 에서 이미 정의한 관리 객체 정의 지침 (GDMO; Guidelines for the Definition of Managed Objects) MIB 모듈뿐만 아니라 IEEE 802.3 최신 개정으로 인한 확장 내용까지를 포함한다. SMIv2 MIB 모듈은 이더넷을 관리하는데 일반적으로 사용하는 SNMP (Simple Network Management Protocol)을 위한 것이다. 본 표준은 이더넷 LLDP 확장 MIB, 이더넷 OAM MIB, 이더넷 리피터 장치 MIB, MDI 를 통한 이더넷 DTE 전원 MIB, EPON MIB, Ethernet-like 인터페이스 MIB, EFMCu 인터페이스 MIB, 이더넷 WIS MIB, 이더넷 MAUs MIB 등의 모듈을 정의한다.

3. 표준 적용 산업 분야 및 산업에 미치는 영향

본 표준은 IEEE 802.3 (이더넷) MIB 정의에 대한 규격을 제공함으로써 네트워크 사업자가 이더넷 기반 장치 (리피터/허브, 스위치 등)의 정보 (Information), 자원 (Resource) 등을 효율적으로 제어 및 감시 할 수 있도록 한다.

Preface

1. Purpose of Standard

This standard specifies Management Information Base (MIB) modules for IEEE 802.3 (Ethernet), includes set of hierarchically managed objects to control, observe Ethernet devices through network management protocol

2. Summary of Contents

This standard includes the Structure of Management Information Version 2 (SMIv2) MIB module specifications formerly produced and published by the Internet Engineering Task Force (IETF), and the Guidelines for the Definition of Managed Objects (GDMO) MIB modules formerly specified within IEEE Std 802.3, as well as extensions resulting from recent amendments to IEEE Std 802.3. The SMIv2 MIB modules are intended for use with the Simple Network Management Protocol (SNMP), commonly used to manage Ethernet. It specifies modules for Ethernet LLDP extension MIB, Ethernet OAM MIB, Ethernet repeater device MIB, Ethernet DTE via MDI MIB, EPON MIB, Ethernet-like interface MIB, EFMCu interface MIB, Ethernet WIS MIB, Ethernet MAUs MIB, etc..

3. Applicable Fields of Industry and its Effect

This standard enables service provider to control, observe information and resource of Ethernet devices effectively by providing MIB definition for IEEE 802.3 (Ethernet).

4. Reference Standards(Recommendations)

4.1. International Standards(Recommendations)

- IEEE 802.3.1-2011, "IEEE Standard for Management Information Base (MIB) Definitions for Ethernet", 2011.7.

4.2. Domestic Standards

- None

5. Relationship to Reference Standards(Recommendations)

5.1. Relationship of Reference Standards

This standard is fully equivalent to IEEE Std 802.3.1-2011.

5.2. Differences between Reference Standard(Recommendation) and this Standard

IEEE Standard for
Management Information Base (MIB)
Definitions for Ethernet

IMPORTANT NOTICE: This standard is not intended to ensure safety, security, health, or environmental protection. Implementers of the standard are responsible for determining appropriate safety, security, environmental, and health practices or regulatory requirements.

This IEEE document is made available for use subject to important notices and legal disclaimers. These notices and disclaimers appear in all publications containing this document and may be found under the heading "Important Notice" or "Important Notices and Disclaimers Concerning IEEE Documents." They can also be obtained on request from IEEE or viewed at http://standards.ieee.org/IPR/disclaimers.html.

1. Overview

This document supersedes and makes obsolete IEEE Std 802.3^{TM}-2008 Annex 30A and Annex 30B, IEEE Std 802.1AB^{TM}-2009 Annex F, IETF RFC 2108, IETF RFC 3621, IETF RFC 3635, IETF RFC 3637, IETF RFC 4836, IETF RFC 4837, IETF RFC 4878, and IETF RFC 5066.[1]

Ethernet technology, as defined by the IEEE 802.3 Working Group of the IEEE, continues to evolve, with scalable increases in speed, new types of cabling and interfaces, and new features. This evolution may require changes in the managed objects in order to reflect this new functionality. This document, as with other documents issued by this working group, reflects a certain stage in the evolution of Ethernet technology. In the future, this document might be revised, or new documents might be issued, in order to reflect the evolution of Ethernet technology.

The term "Ethernet-like interfaces" was historically used because the interfaces defined by the IEEE 802.3 Working Group were not considered "Ethernet" per se, but "Ethernet-like", because "Ethernet" was taken to mean "Ethernet version 2" according to the (DEC, Intel, Xerox) DIX "blue book". Today and in the context of SNMP management and SMIv2 MIB modules, "Ethernet," "Ethernet-like," and "IEEE 802.3" are synonymous and interchangeable in the marketplace. The term "Ethernet-like" is retained in this document because of its common usage in the SNMP-based network management community.

---

[1]Information on references can be found in Clause 2.

1.1 Scope

This standard contains the Management Information Base (MIB) module specifications for IEEE Std 802.3, also known as Ethernet. It includes the Structure of Management Information Version 2 (SMIv2) MIB module specifications formerly produced and published by the Internet Engineering Task Force (IETF), and the Guidelines for the Definition of Managed Objects (GDMO) MIB modules formerly specified within IEEE Std 802.3, as well as extensions resulting from recent amendments to IEEE Std 802.3. The SMIv2 MIB modules are intended for use with the Simple Network Management Protocol (SNMP), commonly used to manage Ethernet.

1.2 Purpose

The purpose of the standard is to publish the SMIv2 and GDMO MIB module specifications in a single document that is separate from IEEE Std 802.3, and that can be published in a machine-readable format. Future amendments and revisions to IEEE Std 802.3.1 will be performed to update the MIB specifications as required to track future amendments and revisions to IEEE Std 802.3.

1.3 Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of IETF RFC 3410.

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP).

Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This standard specifies MIB modules that are compliant to the SMIv2, which is described in IETF STD 58 (RFC 2578), IETF STD 58 (RFC 2579), and IETF STD 58 (RFC 2580).

1.4 Security considerations

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPSec), there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in a MIB module.

Implementers should consider the security features as provided by the SNMPv3 framework (see IETF RFC 3410, section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

SNMPv3 should be deployed, rather than previous versions of SNMP, and cryptographic security should be enabled. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

Throughout this standard, there are a number of accessible management objects that may be considered sensitive or vulnerable in some network environments. The support for some operations in a non-secure environment without proper protection can have a negative effect on network operations. Such management objects are detailed in the clauses that define them.

The user of these MIB modules should therefore be aware that support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

The readable objects in these MIB modules (i.e., those with MAX-ACCESS other than not-accessible) may be considered sensitive in some environments since, collectively, they provide information about the performance of network interfaces and can reveal some aspects of their configuration. In such environments it is important to control GET and NOTIFY access to these objects and possibly encrypt their values when sending them over the network via SNMP.

1.5 Conformance

Specific conformance statements and compliance statements, written in accordance with IETF STD 58, RFC 2580, are included in each MIB module. They can be found by searching for the text strings "Conformance statements" and "Compliance statements".

2. Normative references

The following referenced documents are indispensable for the application of this document (i.e., they must be understood and used, so each referenced document is cited in text and its relationship to this document is explained). For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments or corrigenda) applies.

3. Definitions

For the purposes of this document, the following terms and definitions apply. The *IEEE Standards Dictionary: Glossary of Terms & Definitions* [B6] should be consulted for terms not defined in this clause.[8]

3.1 agent: An entity, typically implemented in software, which provides remote access to management instrumentation, via the Simple Network Management Protocol (SNMP).

3.2 group: Within the context of the repeater management MIB module defined in Clause 7: A recommended, but optional, entity defined in IEEE Std 802.3, Clause 30, in order to support a modular numbering scheme. The classical example allows an implementor to represent field-replaceable units as groups of ports, with the port numbering matching the modular hardware implementation.

3.3 jack type: The jack connector type, as it appears on the outside of the system. The type of mechanical interface to the transmission medium.

3.4 Loss of Codegroup Delineation: *See* IEEE Std 802.3 50.3.5.3.

3.5 managed object: an abstract representation of network resources that are managed. A managed object is defined according to the *Structure of Management Information version 2* (SMIv2) defined in IETF STD 58, RFC 2578.

3.6 managed repeater: A repeater as defined by IEEE Std 802.3 incorporating a management entity that complies with the MIB module definition contained in Clause 7 of this document.

3.7 module: A building block in a modular system. In the context of the MIB definitions, a specification of management capabilities related to the system. In the context of a chassis, it typically maps into one 'slot'; however, the range of configurations may be very large, with several modules entering one slot, or one module covering several slots.

3.8 non-trivial repeater: A repeater as defined by IEEE Std 802.3 having multiple ports.

3.9 Path Coding violations: In IEEE Std 802.3 the path layer coding violations count is based on block errors and not BIP-8 errors, i.e., it is incremented only once for each B3 byte that indicates incorrect parity, regardless of the number of bits in error. Note that Section 8.4.5.1 of ANSI T1.231-1997 allows either path BIP-8 errors or path block errors to be used for the path layer error count.

3.10 repeater system: A managed entity compliant with this standard, and incorporating at least one managed IEEE Std 802.3 repeater.

3.11 repeater-unit: The portion of a repeater that is inboard of its Physical Medium Attachment (PMA)/ Physical Signaling Sublayer (PLS), or PMA/Physical Coding Sublayer (PCS).

3.12 Signal Label Mismatch: This defect is called Payload Label Mismatch (PLM) in IEEE Std 802.3. It is reported by setting both the sonetPathSignalLabelMismatch bit in the appropriate instance of sonetPathCurrentStatus (defined in IETF RFC 3592) and the etherWisPathPLM bit in the corresponding instance of etherWisPathCurrentStatus.

3.13 stack: A scalable system in which modularity is achieved by interconnecting a number of different systems.

---

[8]The numbers in brackets correspond to those of the bibliography in Annex A.

3.14 STS-Path Remote Defect Indication: IEEE Std 802.3 mandates the use of ERDI-P (Enhanced Remote Defect Indication-Path) defined in ANSI T1.231-1997 to signal remote server defects (triggered by path AIS or path LOP) and remote payload defects (triggered by Payload Label Mismatch or Loss of Code-group Delineation). IETF RFC 3592 defines the one-bit RDI-P (Remote Defect Indication-Path), which signals remote server detects (i.e., path AIS and path LOP) only. An implementation of the MIB module defined in Clause 12 sets the sonetPathSTSRDI bit in the appropriate instance of sonetPathCurrentStatus when it receives an ERDI-P server defect indication from the remote end. Both ERDI-P payload defects and ERDI-P server defects are reported in the object etherWisFarEndPathCurrentStatus.

3.15 system: An entity compliant with one or more MIB modules of this standard.

3.16 system interconnect segment: An internal segment allowing interconnection of ports belonging to different physical entities into the same logical managed repeater, bridge, or other system. Examples of implementation might be backplane busses in modular hubs, or chaining cables in stacks of bridges/switches. It is not uncommon for such segments to be a proprietary implementation.

3.17 trivial repeater-unit: An isolated port that can gather statistics.

OAM	operations, administration and maintenance

OAMPDU	operations, administration, and maintenance protocol data unit
OID	object identifier
OLT	optical line terminal
OMP	optical multipoint
ONU	optical network unit
OSI	Open Systems Interconnection
P2MP	point-to-multipoint
P2PE	point-to-point emulation
PAF	PME aggregation function
PBO	power back-off
PCS	physical coding sublayer
PD	powered device
PDU	protocol data unit
PHY	Physical Layer entity
PLM	Payload Label Mismatch
PMA	physical medium attachment
PMD	physical medium dependent
PME	physical medium entity
PON	passive optical network
PSD	power spectral density
PSE	power sourcing equipment
RFC	Request for Comments
ROM	read-only-memory
RS	reconciliation sublayer
RTT	round-trip time
SDH	Synchronous Digital Hierarchy
SLA	service level agreement
SLD	start of LLID delimiter
SMIv2	structure of management information version 2
SNMP	simple network management protocol
SNR	signal to noise ratio
SONET	Synchronous Optical Network
TCPAM	trellis coded pulse amplitude modulation
TDM	time division multiplexing
TDMA	time division multiple access
TLV	type/length/value
TQ	time quanta
WAN	wide area network
WDM	wavelength division multiplexing
WIS	WAN interface sublayer

5. Ethernet logical link discovery protocol (LLDP) extension MIB module

The logical link discovery protocol (LLDP) is defined in IEEE Std 802.1AB-2009 Station and Media Access Control Discovery. Extensions to this protocol for Ethernet are defined in Clause 79 of IEEE Std 802.3.

5.1 Structure of the IEEE 802.3 LLDP extension MIB

Table 5–1 summarizes the particular object groups that are required for each operating mode. The implemented MIB shall comply with the MIB conformance section for the particular operating mode being supported.

Table 5–1—IEEE 802.3 LLDP extension MIB object group conformance requirements

MIB group	Rx mode	Tx mode	Tx/Rx mode
lldpV2Xdot3ConfigGroup	M[a]	M	M
lldpV2Xdot1LocSysGroup	M	—	M
lldpV2Xdot1RemSysGroup	—	M	M
ifGeneralInformationGroup	M	M	M

[a]M = Mandatory

Table 5–2 shows the structure of the MIB and the relationship of the MIB objects to the LLDP operational status/control variables, LLDP statistics variables, and TLV variables.

5.2 Relationship to other MIBs

Version 1 of the IEEE 802.3 LLDP extension MIB module is deprecated.

Table 5–2—IEEE 802.3/LLDP extension MIB cross reference

MIB table	MIB object	LLDP reference
Configuration group		
lldpV2Xdot3PortConfigTable		Augments lldpV2PortConfigEntry
	lldpV2Xdot3PortConfigTLVsTxEnable	Normal LLDPDUs
Local devices information group

5.3 Security considerations for IEEE 802.3 LLDP extension MIB module

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write.[9] Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

Setting the object, lldpXdot3PortConfigTLVsTxEnable, to incorrect values can result in improper operation of LLDP.

The following readable objects in this MIB module may be considered to be sensitive or vulnerable in some network environments:

    a) Objects that are associated with the transmit mode are as follows:
        1) lldpV2Xdot3LocPortAutoNegSupported
        2) lldpV2Xdot3LocPortAutoNegEnabled
        3) lldpV2Xdot3LocPortAutoNegAdvertisedCap
        4) lldpV2Xdot3LocPortOperMauType
        5) lldpV2Xdot3LocPowerPortClass
        6) lldpV2Xdot3LocPowerMDISupported
        7) lldpV2Xdot3LocPowerMDIEnabled
        8) lldpV2Xdot3LocPowerPairControlable
        9) lldpV2Xdot3LocPowerPairs
        10) lldpV2Xdot3LocPowerClass
        11) lldpV2Xdot3LocMaxFrameSize
    b) Objects that are associated with the receive mode are as follows:
        1) lldpV2Xdot3RemPortAutoNegSupported
        2) lldpV2Xdot3RemPortAutoNegEnabled
        3) lldpV2Xdot3RemPortAutoNegAdvertisedCap
        4) lldpV2Xdot3RemPortOperMauType
        5) lldpV2Xdot3RemPowerPortClass
        6) lldpV2Xdot3RemPowerMDISupported
        7) lldpV2Xdot3RemPowerMDIEnabled
        8) lldpV2Xdot3RemPowerPairControlable
        9) lldpV2Xdot3RemPowerPairs
        10) lldpV2Xdot3RemPowerClass
        11) lldpV2Xdot3RemMaxFrameSize

This concern applies both to objects that describe the configuration of the local host, as well as for objects that describe information from the remote hosts, acquired via LLDP and displayed by the objects in this MIB module. It is thus also important to control GET and/or NOTIFY access to these objects and possibly to encrypt the values of these objects when sending them over the network via SNMP.

---

[9]In IETF MIB definitions, the MAX-ACCESS clause defines the type of access that is allowed for particular data elements in the MIB. An explanation of the MAX-ACCESS mapping is given in section 7.3 of IETF STD 58, RFC 2578.

5.4 MIB module definition

In the following MIB definition, should any discrepancy between the DESCRIPTION text and the corresponding definition in 5.2 through 5.3 of this clause occur, the definitions in 5.2 through 5.3 shall take precedence.

An ASCII text version of the MIB definition can be found at the following URL:[10]

http://www.ieee802.org/3/be/public/mib_modules/20110202/802dot3dot1C5mib.txt

Two additional modules must be imported when compiling the IEEE 802.3 LLDP extension MIB module, and they can be found at the following URLs:

http://www.ieee802.org/1/files/public/MIBs/LLDP-V2-MIB-200906080000Z.txt

http://www.ieee802.org/1/files/public/MIBs/LLDP-V2-TC-MIB-200906080000Z.txt

---

[10]Copyright release for MIB modules: Users of this standard may freely reproduce the MIB module contained in this subclause so that it can be used for its intended purpose.

    DESCRIPTION
            "The LLDP Management Information Base extension module for
            IEEE 802.3 organizationally defined discovery information.

            In order to assure the uniqueness of the LLDP-MIB,
            ieee8023lldpV2Xdot3MIB is branched from lldpV2Extensions using
            OUI value as the node. An OUI/'company_id' is a 24-bit
            globally unique assigned number referenced by various standards."

    REVISION "201102020000Z" -- February 2, 2011

    DESCRIPTION
            "This revision incorporated changes to the MIB to
            support the use of LLDP with multiple destination MAC
            addresses, and to deprecate the Link Aggregation TLV
            (now moved to the 802.1 extension MIB)."

}

lldpV2Xdot3PortConfigTLVsTxEnable  OBJECT-TYPE
    SYNTAX      BITS {
            macPhyConfigStatus(0),
            powerViaMDI(1),
            unused(2), --avoids re-use of the old link agg bit number
            maxFrameSize(3)
    }
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
            "The lldpV2Xdot3PortConfigTLVsTxEnable, defined as a bitmap,
            includes the IEEE 802.3 organizationally defined set of LLDP
            TLVs whose transmission is allowed by the local LLDP agent by
            the network management. Each bit in the bitmap corresponds
            to an IEEE 802.3 subtype associated with a specific IEEE
            802.3 optional TLV. The bit 0 is not used since there is
            no corresponding subtype.

            The bit 'macPhyConfigStatus(0)' indicates that the LLDP agent
            should transmit 'MAC/PHY configuration/status TLV'.

            The bit 'powerViaMDI(1)' indicates that the LLDP agent should
            transmit 'Power via MDI TLV'.

            The bit 'unused(2)' is no longer used; this was used for
            the 'Link Aggregation TLV' in the previous version.

            The bit 'maxFrameSize(3)' indicates that the LLDP agent should
            transmit 'Maximum-frame-size TLV'.

            The default value for lldpV2Xdot3PortConfigTLVsTxEnable object
            is an empty set, which means no enumerated values are set.

            The value of this object is restored from non-volatile
            storage after a re-initialization of the management system."

6. Ethernet operations, administration, and maintenance (OAM) MIB module

6.1 Introduction

The IEEE 802.3ah Ethernet in the First Mile (EFM) Task Force added management capabilities to Ethernet-like interfaces to provide some basic operations, administration and maintenance (OAM) functions. The defined functionality includes discovery, error signaling, loopback, and link monitoring.

This clause defines a MIB module for use with SNMP to manage these Ethernet-like interface capabilities.

6.2 Overview

Ethernet OAM is composed of a core set of functions and a set of optional functional groups as described in IEEE Std 802.3 Clause 57. The core functions include discovery operations (determining if the other end of the link is OAM capable and what OAM functions it supports), state machine implementation, and some critical event flows. The optional functional groups are for (a) link events, (b) remote loopback, and (c) variable retrieval and response. Each optional functional group is controlled by a separate MIB table(s).

Ethernet OAM is complementary with SNMP management in that it provides some basic management functions at layer 2, rather than using layer 3 and above as required by SNMP over an IP infrastructure. Ethernet OAM provides single-hop functionality in that it works only between two directly-connected Ethernet stations. SNMP can be used to manage the Ethernet OAM interactions of one Ethernet station with another.

Ethernet OAM has three functional objectives, which are detailed in the next three subclauses. The definition of a basic Ethernet OAM protocol data unit is given in 6.2.4.

6.2.1 Remote fault indication

Remote fault indication provides a mechanism for one end of an Ethernet link to signal the other end that the receive path is non-operational. Some Ethernet physical layers offer mechanisms to signal this condition at the physical layer. Ethernet OAM added a mechanism so that some Ethernet physical layers can operate in unidirectional mode, allowing frames to be transmitted in one direction even when the other direction is non-operational. Traditionally, Ethernet PHYs do not allow frame transmission in one direction if the other direction is not operational. Using this mode, Ethernet OAM allows frame-based signaling of remote fault conditions while still not allowing higher-layer applications to be aware of the unidirectional capability. This clause includes mechanisms for capturing that fault information and reflecting such information in objects and notifications within the SNMP management framework.

6.2.2 Link monitoring

Ethernet OAM includes event signaling capability so that one end of an Ethernet link can indicate the occurrence of certain important events to the other end of the link. This happens via layer 2 protocols. This clause defines methods for incorporating the occurrence of these layer 2 events, both at the local end and far end of the link, into the SNMP management framework.

Ethernet OAM also includes mechanisms for one Ethernet station to query another directly connected Ethernet station about the status of its Ethernet interface variables and status. This clause does not include mechanisms for controlling how one Ethernet endpoint may use this functionality to query the status or statistics of a peer Ethernet entity.

6.2.3 Remote loopback

Remote loopback is a link state where the peer Ethernet entity echoes every received packet (without modifications) back onto the link. Remote loopback is intrusive in that the other end of the link is not forwarding traffic from higher layers out over the link. This clause defines objects controlling loopback operation and reading the status of the loopback state.

6.2.4 Ethernet OAM protocol data units

An Ethernet OAM protocol data unit is a valid Ethernet frame with a destination Media Access Control (MAC) address equal to the reserved MAC address for Slow Protocols (see Annex 57A of IEEE Std 802.3), a lengthOrType field equal to the reserved type for Slow Protocols, and a Slow Protocols subtype equal to that of the subtype reserved for Ethernet OAM.

OAMPDU is used throughout this clause as an abbreviation for Ethernet OAM protocol data unit. OAMPDUs are the mechanism by which two directly connected Ethernet interfaces exchange OAM information.

6.3 Relation to other MIB modules

The definitions presented here are based on Clause 30 and Clause 57 of IEEE Std 802.3. Note that these clauses describe many of these variables and their effects on the MAC sublayer. In some cases, there is a one-to-one relationship between an object in this clause and an object in the Clause 30 MIB. In other cases, the objects of this clause reflect a more complex entity and are reflected by more than one object in the Clause 30 MIB.

The objects defined in this clause manage OAM functionality introduced as part of the 802.3ah project. These objects do not overlap with the Interfaces Group MIB module defined in IETF RFC 2863, the Ethernet-like interface MIB module defined in Clause 10, or any other MIB module currently used to manage various aspects of an Ethernet interface. The objects defined here are defined for Ethernet-like interfaces only and use the same ifIndex as the associated Ethernet interface. Ethernet OAM can be implemented on any Ethernet-like interface.

6.3.1 Relation to other EFM MIB modules

The Ethernet OAM functionality and MIB module is independent of the other functionality and MIB modules derived from IEEE Std 802.3 for copper and EPON. Ethernet OAM may be implemented (or not) on the new EFM interface types, just as it can on any other Ethernet interface.

6.3.2 Mapping of IEEE 802.3 managed objects

Table 6–1 contains the mapping between managed objects defined in IEEE Std 802.3 Clause 30, and managed objects defined in this clause.

All IEEE 802.3 OAM managed objects are reflected in this MIB module.

6.4 MIB structure

The Ethernet OAM MIB objects of this clause focus on the OAM capabilities introduced in IEEE Std 802.3. The MIB objects are partitioned into six different MIB groups.

The dot3OamTable group manages the primary OAM objects of the Ethernet interface. This group controls the state and status of OAM as well as the mode in which it operates. The dot3OamPeerTable maintains the current information on the status and configuration of the peer OAM entity on the Ethernet interface. Managed information includes the capabilities and function available on the peer OAM entity.

The dot3OamLoopbackTable manages the loopback function introduced in IEEE Std 802.3. This table controls enabling and disabling loopback, as well as indicating the loopback status of Ethernet OAM on this interface.

The dot3OamStatsTable maintains statistics on the number and type of Ethernet OAM frames being transmitted and received on the Ethernet interface.

The dot3OamEventConfigTable defines the objects for managing the event notification capability available in Ethernet OAM. With Ethernet OAM, one device may send notifications to its peer devices whenever an important event happens on the local device. This table provides management of which events result in notifications via Ethernet OAM notifications and/or via SNMP notifications.

The dot3OamEventLogTable manages the current status of local and remote events detected via Ethernet OAM. This table is updated whenever local events are detected by Ethernet OAM or whenever Ethernet OAM Event Notifications are received from the peer OAM entity.

There are two notifications defined to report Ethernet OAM events (one for threshold crossing events, one for non-threshold crossing events). Both notifications are contained within the same conformance group.

6.5 Security considerations for Ethernet operations, administration, and maintenance (OAM) MIB module

The readable objects in this module can provide information about network traffic, and therefore may be considered sensitive. In particular, OAM provides mechanisms for reading the IEEE Std 802.3 Clause 30 MIB attributes from a link partner via a specialized layer two protocol. Unlike SNMP, IEEE 802.3 OAM does not include encryption or authentication mechanisms. It should not be used in environments where this interface information is considered sensitive, and where the facility terminations are unprotected. By default, OAM is disabled on Ethernet-like interfaces and is therefore not a risk.

IEEE 802.3 OAM is designed to support deployment in access and enterprise networks. In access networks, one end of a link is the CO-side, and the other is the CPE-side, and the facilities are often protected in wiring cages or closets. In such deployments, it is often the case that the CO-side is protected from access from the CPE-side. Within IEEE 802.3 OAM, this protection from remote access is accomplished by configuring the CPE-side in passive mode using the dot3OamMode attribute. This prevents the CPE from accessing functions and information at the CO-side of the connection. In enterprise networks, read-only interface information is often considered non-sensitive.

The frequency of OAM PDUs on an Ethernet interface does not adversely affect data traffic, as OAM is a slow protocol with very limited bandwidth potential, and it is not required for normal link operation. Although there are a number of objects in this module with read-write or read-create MAX-ACCESS, they have limited effects on user data.

The loopback capability of OAM can have potentially disruptive effects; when remote loopback is enabled, the remote station automatically transmits all received traffic back to the local station except for OAM traffic. This completely disrupts all higher layer protocols such as bridging, IP, and SNMP. Therefore, an attribute (dot3OamLoopbackIgnoreRx) was introduced to control whether the local station processes or ignores received loopback commands.

The administrative state and mode are also read-write objects. Disabling OAM can interrupt management activities between peer devices, potentially causing serious problems. Setting the dot3OamMode to an undesired value can allow access to Ethernet monitoring, events, and functions that may not be acceptable in a particular deployment scenario. In addition to loopback functionality, Ethernet interface statistics and events can be accessed via the OAM protocol, which may not be desired in some circumstances.

OAM event configuration also contains read-write objects. These objects control whether events are sent, and at what thresholds. Note that the frequency of event communication is limited by the frequency limits of Slow Protocols on Ethernet interfaces. Also, the information available via OAM events is also available via OAM Variable Requests. Access to this information via either OAM events or Variable Requests is controlled by the dot3OamAdminState and dot3OamMode objects. As mentioned previously, inadequate protection of these variables can result in access to link information and functions.

        DESCRIPTION
          "The MIB module for managing the new Ethernet OAM features
           introduced by the Ethernet in the First Mile Task Force (IEEE
           802.3ah). The functionality presented here is based on IEEE
           Std 802.3ah, released in October, 2004, which was prepared as
           an addendum to IEEE Std 802.3. Since then, IEEE Std 802.3ah
           has been merged into the base IEEE 802.3 standard.

           In particular, this MIB focuses on the new OAM functions
           introduced in Clause 57 of IEEE Std 802.3. The OAM functionality
           of Clause 57 is controlled by new management attributes
           introduced in Clause 30 of IEEE Std 802.3. The OAM functions are
           not specific to any particular Ethernet physical layer, and
           can be generically applied to any Ethernet interface.

           An Ethernet OAM protocol data unit is a valid Ethernet frame
           with a destination MAC address equal to the reserved MAC
           address for Slow Protocols (See 57A of IEEE Std 802.3), a
           lengthOrType field equal to the reserved type for Slow
           Protocols, and a Slow Protocols subtype equal to that of the
           subtype reserved for Ethernet OAM. OAMPDU is used throughout
           this document as an abbreviation for Ethernet OAM protocol
           data unit."

        REVISION    "201102020000Z" -- February 2, 2011

     "This object is used to provision the default administrative
     OAM mode for this interface. This object represents the
     desired state of OAM for this interface.

     The dot3OamAdminState always starts in the disabled(2) state
     until an explicit management action or configuration
     information retained by the system causes a transition to the
     enabled(1) state. When enabled(1), Ethernet OAM will attempt
     to operate over this interface.
     "
   REFERENCE    "IEEE Std 802.3, 30.3.6.1.2"
   ::= { dot3OamEntry 1 }

dot3OamOperStatus OBJECT-TYPE
   SYNTAX       INTEGER {
                   disabled(1),
                   linkFault(2),
                   passiveWait(3),
                   activeSendLocal(4),
                   sendLocalAndRemote(5),
                   sendLocalAndRemoteOk(6),
                   oamPeeringLocallyRejected(7),
                   oamPeeringRemotelyRejected(8),
                   operational(9),
                   nonOperHalfDuplex(10)
                }
   MAX-ACCESS   read-only
   STATUS       current
   DESCRIPTION
     "At initialization and failure conditions, two OAM entities on
     the same full-duplex Ethernet link begin a discovery phase to
     determine what OAM capabilities may be used on that link. The
     progress of this initialization is controlled by the OAM
     sublayer.

     This value is always disabled(1) if OAM is disabled on this
     interface via the dot3OamAdminState.

     If the link has detected a fault and is transmitting OAMPDUs
     with a link fault indication, the value is linkFault(2).
     Also, if the interface is not operational (ifOperStatus is
     not up(1)), linkFault(2) is returned. Note that the object
     ifOperStatus may not be up(1) as a result of link failure or
     administrative action (ifAdminState being down(2) or
     testing(3)).
```

The passiveWait(3) state is returned only by OAM entities in
passive mode (dot3OamMode) and reflects the state in which the
OAM entity is waiting to see if the peer device is OAM
capable. The activeSendLocal(4) value is used by active mode
devices (dot3OamMode) and reflects the OAM entity actively
trying to discover whether the peer has OAM capability but has
not yet made that determination.

The state sendLocalAndRemote(5) reflects that the local OAM
entity has discovered the peer but has not yet accepted or
rejected the configuration of the peer. The local device can,
for whatever reason, decide that the peer device is
unacceptable and decline OAM peering. If the local OAM entity
rejects the peer OAM entity, the state becomes
oamPeeringLocallyRejected(7). If the OAM peering is allowed
by the local device, the state moves to
sendLocalAndRemoteOk(6). Note that both the
sendLocalAndRemote(5) and oamPeeringLocallyRejected(7) states
fall within the state SEND_LOCAL_REMOTE of the Discovery state
diagram (see IEEE Std 802.3, Figure 57-5), with the difference being
whether the local OAM client has actively rejected the peering
or has just not indicated any decision yet. Whether a peering
decision has been made is indicated via the local flags field
in the OAMPDU (reflected in the aOAMLocalFlagsField of
30.3.6.1.10).

If the remote OAM entity rejects the peering, the state
becomes oamPeeringRemotelyRejected(8). Note that both the
sendLocalAndRemoteOk(6) and oamPeeringRemotelyRejected(8)
states fall within the state SEND_LOCAL_REMOTE_OK of the
Discovery state diagram (see IEEE Std 802.3, Figure 57-5), with the
difference being whether the remote OAM client has rejected
the peering or has just not yet decided. This is indicated
via the remote flags field in the OAMPDU (reflected in the
aOAMRemoteFlagsField of 30.3.6.1.11).

When the local OAM entity learns that both it and the remote
OAM entity have accepted the peering, the state moves to
operational(9) corresponding to the SEND_ANY state of the
Discovery state diagram (see IEEE Std 802.3, Figure 57-5).

Since Ethernet OAM functions are not designed to work
completely over half-duplex interfaces, the value
nonOperHalfDuplex(10) is returned whenever Ethernet OAM is
enabled (dot3OamAdminState is enabled(1)), but the interface
is in half-duplex operation.

    ::= { dot3OamEntry 2 }

dot3OamMode OBJECT-TYPE
    SYNTAX   INTEGER {
                    passive(1),
                    active(2)
                }
    MAX-ACCESS   read-write
    STATUS   current
    DESCRIPTION

"This object configures the mode of OAM operation for this
Ethernet-like interface. OAM on Ethernet interfaces may be in
'active' mode or 'passive' mode. These two modes differ in
that active mode provides additional capabilities to initiate
monitoring activities with the remote OAM peer entity, while
passive mode generally waits for the peer to initiate OAM
actions with it. As an example, an active OAM entity can put
the remote OAM entity in a loopback state, where a passive OAM
entity cannot.

The default value of dot3OamMode is dependent on the type of
system on which this Ethernet-like interface resides. The
default value should be 'active(2)' unless it is known that
this system should take on a subservient role to the other
device connected over this interface.

Changing this value results in incrementing the configuration
revision field of locally generated OAMPDUs (30.3.6.1.12) and
potentially re-doing the OAM discovery process if the
dot3OamOperStatus was already operational(9).

```
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
      "The OAM functions supported on this Ethernet-like interface.
      OAM consists of separate functional sets beyond the basic
      discovery process that is always required. These functional
      groups can be supported independently by any implementation.
      These values are communicated to the peer via the local
      configuration field of Information OAMPDUs.

      Setting 'unidirectionalSupport(0)' indicates that the OAM
      entity supports the transmission of OAMPDUs on links that are
      operating in unidirectional mode (traffic flowing in one
      direction only). Setting 'loopbackSupport(1)' indicates that
      the OAM entity can initiate and respond to loopback commands.
      Setting 'eventSupport(2)' indicates that the OAM entity can
      send and receive Event Notification OAMPDUs. Setting
      'variableSupport(3)' indicates that the OAM entity can send
      and receive Variable Request and Response OAMPDUs.

                  unidirectionalSupport (0),
                  loopbackSupport(1),
                  eventSupport(2),
                  variableSupport(3)
```

```
                    }
      MAX-ACCESS  read-only
      STATUS      current
      DESCRIPTION
        "The OAM functions supported on this Ethernet-like interface.
        OAM consists of separate functionality sets above the basic
        discovery process. This value indicates the capabilities of
        the peer OAM entity with respect to these functions. This
        value is initialized so all bits are clear.

        If unidirectionalSupport(0) is set, then the peer OAM entity
        supports sending OAM frames on Ethernet interfaces when the
        receive path is known to be inoperable. If
        loopbackSupport(1) is set, then the peer OAM entity can send
        and receive OAM loopback commands. If eventSupport(2) is set,
        then the peer OAM entity can send and receive event OAMPDUs to
        signal various error conditions. If variableSupport(3) is
        set, then the peer OAM entity can send and receive variable
        requests to monitor the attribute value as described in Clause
        57 of IEEE Std 802.3.

        The capabilities of the OAM peer can be determined from the
        configuration field of the Local Information TLV of the most
        recently received Information OAMPDU with a Local Information
        TLV. All zeros are returned if no Local Information TLV has
        yet been received.

   dot3OamLoopbackTable OBJECT-TYPE
      SYNTAX      SEQUENCE OF Dot3OamLoopbackEntry
      MAX-ACCESS  not-accessible
      STATUS      current
      DESCRIPTION
        "This table contains controls for the loopback state of the
        local link as well as indicates the status of the loopback
        function. There is one entry in this table for each entry in
        dot3OamTable that supports loopback functionality (where
        dot3OamFunctionsSupported includes the loopbackSupport bit
        set).

        Loopback can be used to place the remote OAM entity in a state
        where every received frame (except OAMPDUs) is echoed back
        over the same interface on which they were received. In this
        state, at the remote entity, 'normal' traffic is disabled as
        only the looped back frames are transmitted on the interface.
        Loopback is thus an intrusive operation that prohibits normal
        data flow and should be used accordingly.
        "

                        noLoopback (1),

                        -- initiatingLoopback can be read or written
                        initiatingLoopback (2),
                        remoteLoopback (3),

                        -- terminatingLoopback can be read or written
                        terminatingLoopback (4),
                        localLoopback (5),
                        unknown (6)
                    }
       MAX-ACCESS   read-write
       STATUS       current
       DESCRIPTION
         "The loopback status of the OAM entity. This status is
         determined by a combination of the local parser and
         multiplexer states, the remote parser and multiplexer states,
         as well as by the actions of the local OAM client. When
         operating in normal mode with no loopback in progress, the
         status reads noLoopback(1).

         The values initiatingLoopback(2) and terminatingLoopback(4)
         can be read or written. The other values can only be read -
         they can never be written. Writing initiatingLoopback causes
         the local OAM entity to start the loopback process with its
         peer. This value can only be written when the status is
         noLoopback(1). Writing the value initiatingLoopback(2) in any
         other state has no effect. When in remoteLoopback(3), writing
         terminatingLoopback(4) causes the local OAM entity to initiate
         the termination of the loopback state. Writing
         terminatingLoopack(4) in any other state has no effect.

         If the OAM client initiates a loopback and has sent a
         Loopback OAMPDU and is waiting for a response, where the local
         parser and multiplexer states are DISCARD (see IEEE Std 802.3,
         57.2.11.1), the status is 'initiatingLoopback'. In this
```

```
          case, the local OAM entity has yet to receive any
          acknowledgment that the remote OAM entity has received its
          loopback command request.
          If the local OAM client knows that the remote OAM entity is in
          loopback mode (via the remote state information as described
          in IEEE Std 802.3, 57.2.11.1, 30.3.6.1.15), the status is
          remoteLoopback(3). If the local OAM client is in the process
          of terminating the remote loopback (see IEEE Std 802.3, 57.2.11.3,
          30.3.6.1.14) with its local multiplexer and parser states in
          DISCARD, the status is terminatingLoopback(4). If the remote
          OAM client has put the local OAM entity in loopback mode as
          indicated by its local parser state, the status is
          localLoopback(5).

          The unknown(6) status indicates that the parser and
          multiplexer combination is unexpected. This status may be
          returned if the OAM loopback is in a transition state but
          should not persist.

          The values of this attribute correspond to the following
          values of the local and remote parser and multiplexer states.

            value            LclPrsr   LclMux    RmtPrsr   RmtMux
            noLoopback         FWD       FWD       FWD       FWD
            initLoopback     DISCARD   DISCARD     FWD       FWD
            rmtLoopback      DISCARD     FWD      LPBK     DISCARD
            tmtngLoopback    DISCARD   DISCARD    LPBK     DISCARD
            lclLoopback        LPBK    DISCARD   DISCARD     FWD
            unknown            ***    any other combination  ***

   MAX-ACCESS   read-only
   STATUS       current
   DESCRIPTION
     "A count of the number of frames that were dropped by the OAM
     multiplexer. Since the OAM multiplexer has multiple inputs
     and a single output, there may be cases where frames are
     dropped due to transmit resource contention. This counter is
     incremented whenever a frame is dropped by the OAM layer.
     Note that any Ethernet frame, not just OAMPDUs, may be dropped
     by the OAM layer. This can occur when an OAMPDU takes
     precedence over a 'normal' frame resulting in the 'normal'
     frame being dropped.

     When this counter is incremented, no other counters in this
     MIB are incremented.

     Discontinuities of this counter can occur at re-initialization
```

```
        of the management system, and at other times as indicated by
        the value of the ifCounterDiscontinuityTime.

   dot3OamEventConfigTable OBJECT-TYPE
      SYNTAX      SEQUENCE OF Dot3OamEventConfigEntry
      MAX-ACCESS not-accessible
      STATUS      current
      DESCRIPTION
        "Ethernet OAM includes the ability to generate and receive
        Event Notification OAMPDUs to indicate various link problems.
        This table contains the mechanisms to enable Event
        Notifications and configure the thresholds to generate the
        standard Ethernet OAM events. There is one entry in the table
        for every entry in dot3OamTable that supports OAM events
        (where dot3OamFunctionsSupported includes the eventSupport
        bit set). The values in the table are maintained across
        changes to dot3OamOperStatus.

        The standard threshold crossing events are:
          - Errored Symbol Period Event. Generated when the number of
            symbol errors exceeds a threshold within a given window
            defined by a number of symbols (for example, 1,000 symbols
            out of 1,000,000 had errors).
          - Errored Frame Period Event. Generated when the number of
            frame errors exceeds a threshold within a given window
            defined by a number of frames (for example, 10 frames out
            of 1000 had errors).
          - Errored Frame Event. Generated when the number of frame
            errors exceeds a threshold within a given window defined
            by a period of time (for example, 10 frames in 1 second
            had errors).
          - Errored Frame Seconds Summary Event. Generated when the
            number of errored frame seconds exceeds a threshold within
            a given time period (for example, 10 errored frame seconds
            within the last 100 seconds). An errored frame second is
            defined as a 1 second interval which had >0 frame errors.
        There are other events (dying gasp, critical events) that are
        not threshold crossing events but which can be
        enabled/disabled via this table.

dot3OamEventLogTable OBJECT-TYPE
  SYNTAX       SEQUENCE OF Dot3OamEventLogEntry
  MAX-ACCESS   not-accessible
  STATUS       current
  DESCRIPTION
    "This table records a history of the events that have occurred
    at the Ethernet OAM level. These events can include locally
    detected events, which may result in locally generated
    OAMPDUs, and remotely detected events, which are detected by
    the OAM peer entity and signaled to the local entity via
    Ethernet OAM. Ethernet OAM events can be signaled by Event
    Notification OAMPDUs or by the flags field in any OAMPDU.

    This table contains both threshold crossing events and
    non-threshold crossing events. The parameters for the
    threshold window, threshold value, and actual value
    (dot3OamEventLogWindowXX, dot3OamEventLogThresholdXX,
    dot3OamEventLogValue) are only applicable to threshold
    crossing events, and are returned as all F's (2^32 - 1) for
    non-threshold crossing events.

    Entries in the table are automatically created when such
    events are detected. The size of the table is implementation
    dependent. When the table reaches its maximum size, older
    entries are automatically deleted to make room for newer
    entries.
    "

dot3OamEventLogEntry OBJECT-TYPE
  SYNTAX       Dot3OamEventLogEntry
  MAX-ACCESS   not-accessible
```

```
    STATUS      current
    DESCRIPTION
      "An entry in the dot3OamEventLogTable. Entries are
      automatically created whenever Ethernet OAM events occur at
      the local OAM entity, and when Event Notification OAMPDUs are
      received at the local OAM entity (indicating that events have
      occurred at the peer OAM entity). The size of the table is
      implementation dependent, but when the table becomes full,
      older events are automatically deleted to make room for newer
      events. The table index dot3OamEventLogIndex increments for
      each new entry, and when the maximum value is reached, the
      value restarts at zero.

dot3OamEventLogType       OBJECT-TYPE
  SYNTAX       Unsigned32
  MAX-ACCESS   read-only
  STATUS       current
  DESCRIPTION
    "The type of event that generated this entry in the event log.
    When the OUI is the IEEE 802.3 OUI of 0x0180C2, the following
    event types are defined:
        erroredSymbolEvent(1),
        erroredFramePeriodEvent(2),
        erroredFrameEvent(3),
        erroredFrameSecondsEvent(4),
        linkFault(256),
        dyingGaspEvent(257),
        criticalLinkEvent(258)
    The first four are considered threshold crossing events, as
    they are generated when a metric exceeds a given value within
    a specified window. The other three are not threshold
    crossing events.

    When the OUI is not 71874 (0x0180C2 in hex), then some other
    organization has defined the event space. If event subtyping
    is known to the implementation, it may be reflected here.
    Otherwise, this value should return all F's (2^32 - 1).

7. Ethernet repeater device MIB module

7.1 Overview

This clause defines a portion of the Management Information Base (MIB) for use with SNMP. In particular, it defines objects for managing IEEE Std 802.3 repeaters.

7.1.1 Repeater management

Instances of the object types defined in this clause represent attributes of an IEEE 802.3 (Ethernet-like) repeater, as defined by Clause 9, "Repeater Unit for 10 Mb/s Baseband Networks" and Clause 27, "Repeater for 100 Mb/s Baseband Networks" of IEEE Std 802.3. Implementors of these MIB objects should note that IEEE Std 802.3 explicitly describes when, where, and how various repeater attributes are measured. IEEE Std 802.3 also describes the effects of repeater actions that may be invoked by manipulating instances of the MIB objects defined here. The definitions presented here are based on 30.4 of IEEE Std 802.3. The counters in this clause are defined to be the same as the counters defined in IEEE Std 802.3, with the intention that the same instrumentation can be used to implement both standards.

These repeater MIB module objects may be used to manage non-standard repeater-like devices; however, defining objects to describe implementation-specific properties of non-standard repeater-like devices is outside the scope of this standard.

7.1.2 Structure of the MIB

Objects in this MIB module are arranged into packages, each of which contains a set of related objects within a broad functional category. Objects within a package are generally defined under the same OID subtree. These packages are intended for organizational convenience only, and have no relation to the conformance groups defined later in the document.

7.1.2.1 Basic definitions

The basic definitions include objects that are applicable to all repeaters: status, parameter, and control objects for each repeater within the managed system, for the port groups within the system, and for the individual ports themselves.

7.1.2.2 Monitor definitions

The monitor definitions include monitoring statistics for each repeater within the system and for individual ports.

7.1.2.3 Address tracking definitions

This collection includes objects for tracking the MAC addresses of the DTEs attached to the ports within the system and for mapping the topology of a network.

7.1.2.4 Top N definitions

These objects may be used for tracking the ports with the most activity within the system or within particular repeaters.

7.1.3 Relationship to MIB-II

It is assumed that a repeater implementing this MIB will also implement (at least) the 'system' group defined in IETF RFC 1213 (MIB-II).

7.1.3.1 Relationship to the 'system' group

In MIB-II, the 'system' group is defined as being mandatory for all systems such that each managed entity contains one instance of each object in the 'system' group. Thus, those objects apply to the entity even if the entity's sole functionality is management of repeaters.

7.1.3.2 Relationship to the 'interfaces' group

In MIB-II, the 'interfaces' group is defined as being mandatory for all systems and contains information on an entity's interfaces, where each interface is thought of as being attached to a 'subnetwork'. (Note that this term is not to be confused with 'subnet', which refers to an addressing partitioning scheme used in the Internet suite of protocols.)

This repeater MIB module uses the notion of ports on a repeater. The concept of a MIB-II interface has no specific relationship to a repeater's port. Therefore, the 'interfaces' group applies only to the one (or more) network interfaces on which the entity managing the repeater sends and receives management protocol operations, and does not apply to the repeater's ports. This is consistent with the physical-layer nature of a repeater. A repeater-unit is a bitwise store-and-forward device. A repeater port has no MAC address, no MAC implementation, and does not pass packets up to higher-level protocol entities for processing.

NOTE—When a network management entity is observing a repeater, it may appear as though the repeater is passing packets to a higher-level protocol entity. However, this is only a means of implementing management, and this passing of management information is not part of the repeater functionality.[12]

7.2 Topology mapping

Network topology mapping is described in section 4 of IETF RFC 2108 [B19].

7.3 MIB module definition

An ASCII text version of the MIB definition can be found at the following URL:[13]

http://www.ieee802.org/3/be/public/mib_modules/20110202/802dot3dot1C7mib.txt

---

[12]Notes in text, tables, and figures are given for information only and do not contain requirements needed to implement the standard.

[13]Copyright release for MIB modules: Users of this standard may freely reproduce the MIB module contained in this subclause so that it can be used for its intended purpose.

                     }
        MAX-ACCESS  read-only
        STATUS      current
        DESCRIPTION
                "An object that indicates the operational status
                of the group.

                A status of notPresent(4) indicates that the group
                is temporarily or permanently physically and/or
                logically not a part of the repeater. It is an
                implementation-specific matter as to whether the
                agent effectively removes notPresent entries from
                the table.

                A status of operational(2) indicates that the
                group is functioning, and a status of
                malfunctioning(3) indicates that the group is
                malfunctioning in some way."
        ::= { rptrGroupEntry 3 }

    rptrGroupPortCapacity OBJECT-TYPE
        SYNTAX      Integer32 (1..2147483647)
        MAX-ACCESS  read-only
        STATUS      current
        DESCRIPTION
                "The rptrGroupPortCapacity is the number of ports
                that can be contained within the group. Valid
                range is 1-2147483647. Within each group, the
                ports are uniquely numbered in the range from 1 to
                rptrGroupPortCapacity.

                Some ports may not be present in the repeater system, in
                which case the actual number of ports present
                will be less than the value of rptrGroupPortCapacity.
                The number of ports present in the group will never
                be greater than the value of rptrGroupPortCapacity.

                Note:  In practice, this will generally be the
                number of ports on a module, card, or board, and
                the port numbers will correspond to numbers marked
                on the physical embodiment."

rptrPortAdminStatus OBJECT-TYPE
    SYNTAX        INTEGER {
                    enabled(1),
                    disabled(2)
                  }
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
            "Setting this object to disabled(2) disables the
            port. A disabled port neither transmits nor
            receives. Once disabled, a port shall be
            explicitly enabled to restore operation. A port
            which is disabled when power is lost or when a
            reset is exerted shall remain disabled when normal
            operation resumes.

            The admin status takes precedence over auto-
            partition and functionally operates between the
            auto-partition mechanism and the AUI/PMA.

            Setting this object to enabled(1) enables the port
            and exerts a BEGIN on the port's auto-partition
            state machine.

            (In effect, when a port is disabled, the value of
            rptrPortAutoPartitionState for that port is frozen
            until the port is next enabled. When the port
            becomes enabled, the rptrPortAutoPartitionState
            becomes notAutoPartitioned(1), regardless of its
            pre-disabling state.)"

rptrInfoReset OBJECT-TYPE
     SYNTAX     INTEGER {
                    noReset(1),
                    reset(2)
                }
     MAX-ACCESS  read-write
     STATUS      current
     DESCRIPTION
             "Setting this object to reset(2) causes a
             transition to the START state of Figure 9-2 in
             Clause 9 IEEE Std 802.3 for a 10 Mb/s repeater,
             and to the START state of Figure 27-2 in Clause 27
             of that standard for a 100 Mb/s repeater.

             Setting this object to noReset(1) has no effect.
             The agent will always return the value noReset(1)
             when this object is read.

             After receiving a request to set this variable to
             reset(2), the agent is allowed to delay the reset
             for a short period. For example, the implementor
             may choose to delay the reset long enough to allow
             the SNMP response to be transmitted. In any
             event, SNMP requires that a response be transmitted.

             This action does not reset the management counters
             defined in this document nor does it affect the
             portAdminStatus parameters. Included in this
             action is the execution of a disruptive Self-Test
             with the following characteristics:  a) The nature
             of the tests is not specified. b) The test resets
             the repeater but without affecting management
             information about the repeater. c) The test does
             not inject packets onto any segment. d) Packets
             received during the test may or may not be
             transferred. e) The test does not interfere with
             management functions.

             After performing this self-test, the agent will
             update the repeater health information (including
             rptrInfoOperStatus), and send a rptrInfoResetEvent
             notification."

```

```
                    This statistic provides one of the parameters
                    necessary for obtaining the packet error rate.
                    The approximate minimum time for rollover of this
                    counter is 80 hours at 10 Mb/s."
            REFERENCE
                    "IEEE Std 802.3, 30.4.3.1.4, aReadableFrames."
            ::= { rptrMonitorPortEntry 3 }

    rptrMonitorPortReadableOctets OBJECT-TYPE
            SYNTAX      Counter32
            MAX-ACCESS  read-only
            STATUS      current
            DESCRIPTION
                    "This object is the number of octets contained in
                    valid frames that have been received on this port.
                    This counter is incremented by OctetCount for each
                    frame received on this port which has been
                    determined to be a readable frame (i.e., including
                    FCS octets but excluding framing bits and dribble
                    bits).

                    A discontinuity may occur in the value
                    when the value of object
                    rptrMonitorPortLastChange changes.

                    This statistic provides an indicator of the total
                    data transferred. The approximate minimum time
                    for rollover of this counter in a 10 Mb/s repeater
                    is 58 minutes.

                    For ports receiving traffic at a maximum rate in
                    a 100 Mb/s repeater, this counter can roll over
                    in less than 6 minutes. Since that amount of time
                    could be less than a management station's poll cycle
                    time, in order to avoid a loss of information a
                    management station is advised to also poll the
                    rptrMonitorPortUpper32Octets object, or to use the
                    64-bit counter defined by
                    rptrMonitorPortHCReadableOctets instead of the
                    two 32-bit counters."

rptrMonitorPortShortEvents OBJECT-TYPE
    SYNTAX      Counter32
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
            "This counter is incremented by one for each
            CarrierEvent on this port with ActivityDuration
            less than ShortEventMaxTime. ShortEventMaxTime is
            greater than 74 bit times and less than 82 bit
            times. ShortEventMaxTime has tolerances included
            to provide for circuit losses between a
            conformance test point at the AUI and the
            measurement point within the state machine.

            Notes:

            ShortEvents may indicate externally
            generated noise hits which will cause the repeater
            to transmit Runts to its other ports, or propagate
            a collision (which may be late) back to the
            transmitting DTE and damaged frames to the rest of
            the network.

            Implementors may wish to consider selecting the
            ShortEventMaxTime towards the lower end of the
            allowed tolerance range to accommodate bit losses
            suffered through physical channel devices not
            budgeted for within this standard.

            The significance of this attribute is different
            in 10 and 100 Mb/s collision domains. Clause 9
            repeaters perform fragment extension of short
            events which would be counted as runts on the
            interconnect ports of other repeaters. Clause
            27 repeaters do not perform fragment extension.

            A discontinuity may occur in the value
            when the value of object
            rptrMonitorPortLastChange changes.

            The approximate minimum time for rollover of this
            counter is 16 hours in a 10 Mb/s repeater."
    REFERENCE
            "IEEE Std 802.3, 30.4.3.1.9, aShortEvents."
    ::= { rptrMonitorPortEntry 8 }

rptrMonitorPortRunts OBJECT-TYPE
    SYNTAX      Counter32
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
            "This counter is incremented by one for each
            CarrierEvent on this port that meets one of the
            following two conditions. Only one test need be
            made. a) The ActivityDuration is greater than
            ShortEventMaxTime and less than ValidPacketMinTime
            and the CollisionEvent signal is deasserted. b)
            The OctetCount is less than 64, the
            ActivityDuration is greater than ShortEventMaxTime
```

and the CollisionEvent signal is deasserted.
ValidPacketMinTime is greater than or equal to 552
bit times and less than 565 bit times.

An event whose length is greater than 74 bit times
but less than 82 bit times shall increment either
the shortEvents counter or the runts counter but
not both. A CarrierEvent greater than or equal to
552 bit times but less than 565 bit times may or
may not be counted as a runt.

ValidPacketMinTime has tolerances included to
provide for circuit losses between a conformance
test point at the AUI and the measurement point
within the state machine.

Runts usually indicate collision fragments, a
normal network event. In certain situations
associated with large diameter networks a
percentage of collision fragments may exceed
ValidPacketMinTime.
A discontinuity may occur in the value
when the value of object
rptrMonitorPortLastChange changes.

The approximate minimum time for rollover of this
counter is 16 hours in a 10 Mb/s repeater."
    REFERENCE
            "IEEE Std 802.3, 30.4.3.1.10, aRunts."
    ::= { rptrMonitorPortEntry 9 }

    ::= { rptrMonitorPortEntry 10 }

rptrMonitorPortLateEvents OBJECT-TYPE
    SYNTAX   Counter32
    MAX-ACCESS read-only
    STATUS   current

```
DESCRIPTION
        "For a Clause 9 repeater port, this counter is
        incremented by one for each CarrierEvent
        on this port in which the CollIn(X)
        variable transitions to the value SQE (see
        9.6.6.2, IEEE Std 802.3) while the
        ActivityDuration is greater than the
        LateEventThreshold. For a Clause 27 repeater
        port, this counter is incremented by one on
        entering the Collision Count Increment state
        of the  partition state diagram (Figure 27-8)
        while the  ActivityDuration is greater than
        the LateEvent- Threshold. Such a CarrierEvent
        is counted twice, as both a collision and as a
        lateEvent.

        The LateEventThreshold is greater than 480 bit
        times and less than 565 bit times.
        LateEventThreshold has tolerances included to
        permit an implementation to build a single
        threshold to serve as both the LateEventThreshold
        and ValidPacketMinTime threshold.

        A discontinuity may occur in the value
        when the value of object
        rptrMonitorPortLastChange changes.

        The approximate minimum time for rollover of this
        counter is 81 hours in a 10 Mb/s repeater."

rptrMonitorPortDataRateMismatches OBJECT-TYPE
    SYNTAX      Counter32
```

```
     MAX-ACCESS  read-only
     STATUS      current
     DESCRIPTION
             "This counter is incremented by one for each
             frame received by this port that meets all
             of the conditions required by only one of the
             following two measurement methods:

             Measurement method A:  1) The CollisionEvent
             signal is not asserted (10 Mb/s operation) or
             the Collision Count Increment state of the
             partition state diagram (figure 27-8 of
             IEEE Std 802.3) has not been entered
             (100 Mb/s operation). 2) The ActivityDuration
             is greater than ValidPacketMinTime. 3) The
             frequency (data rate) is detectably mismatched
             from the local transmit frequency.

             Measurement method B:  1) The CollisionEvent
             signal is not asserted (10 Mb/s operation)
             or the Collision Count Increment state of the
             partition state diagram (figure 27-8 of
             IEEE Std 802.3) has not been entered
             (100 Mb/s operation). 2) The OctetCount is
             greater than 63. 3) The frequency (data
             rate) is detectably mismatched from the local
             transmit frequency. The exact degree of
             mismatch is vendor specific and is to be
             defined by the vendor for conformance testing.

             When this event occurs, other counters whose
             increment conditions were satisfied may or may not
             also be incremented, at the implementor's
             discretion. Whether or not the repeater was able
             to maintain data integrity is beyond the scope of
             this standard.

             A discontinuity may occur in the value
             when the value of object
             rptrMonitorPortLastChange changes."

rptrMonitorPortAutoPartitions OBJECT-TYPE
     SYNTAX      Counter32
     MAX-ACCESS  read-only
     STATUS      current
     DESCRIPTION
             "This counter is incremented by one for
             each time the repeater has automatically
             partitioned this port.

             The conditions that cause a Clause 9
             repeater port to partition are specified in
             the partition state diagram in Clause 9 of
             IEEE Std 802.3. They are not differentiated
             here. A Clause 27 repeater port partitions
             on entry to the Partition Wait state of the
```

```
                    partition state diagram (Figure 27-8 in
                    IEEE Std 802.3).

                    A discontinuity may occur in the value
                    when the value of object
                    rptrMonitorPortLastChange changes."
           REFERENCE
                    "IEEE Std 802.3, 30.4.3.1.15, aAutoPartitions."
           ::= { rptrMonitorPortEntry 14 }

     rptrMonitorPortTotalErrors OBJECT-TYPE
           SYNTAX      Counter32
           MAX-ACCESS  read-only
           STATUS      current
           DESCRIPTION
                    "The total number of errors which have occurred on
                    this port. This counter is the summation of the
                    values of other error counters (for the same
                    port), namely:

                        rptrMonitorPortFCSErrors,
                        rptrMonitorPortAlignmentErrors,
                        rptrMonitorPortFrameTooLongs,
                        rptrMonitorPortShortEvents,
                        rptrMonitorPortLateEvents,
                        rptrMonitorPortVeryLongEvents,
                        rptrMonitorPortDataRateMismatches, and
                        rptrMonitorPortSymbolErrors.

                    This counter is redundant in the sense that it is
                    the summation of information already available
                    through other objects. However, it is included
                    specifically because the regular retrieval of this
                    object as a means of tracking the health of a port
                    provides a considerable optimization of network
                    management traffic over the otherwise necessary
                    retrieval of the summed counters.

                    Note that rptrMonitorPortRunts is not included
                    in this total; this is because runts usually
                    indicate collision fragments, a normal network
                    event.

                    A discontinuity may occur in the value
                    when the value of object
                    rptrMonitorPortLastChange changes."

  rptrMonitorPortSymbolErrors OBJECT-TYPE
      SYNTAX     Counter32
      MAX-ACCESS read-only
      STATUS     current
      DESCRIPTION
              "This counter is incremented by one each time when
              valid length packet was received at the port and
              there was at least one occurrence of an invalid
              data symbol. This can increment only once per valid
              carrier event. A collision presence at any port of
              the repeater containing port N, will not cause this
              attribute to increment.

              A discontinuity may occur in the value
              when the value of object
              rptrMonitorPortLastChange changes.

              The approximate minimum time for rollover of this
              counter is 7.4 hours at 100 Mb/s."

  rptrMonitorPortUpper32Octets OBJECT-TYPE
      SYNTAX     Counter32
      MAX-ACCESS read-only
      STATUS     current
      DESCRIPTION
              "This object is the number of octets contained in
              valid frames that have been received on this port,
              modulo 2**32. That is, it contains the upper 32
              bits of a 64-bit octets counter, of which the
              lower 32 bits are contained in the
              rptrMonitorPortReadableOctets object.

              This two-counter mechanism is provided for those
              network management protocols that do not support
              64-bit counters (e.g. SNMP V1) and are used to
              manage a repeater type of 100 Mb/s.

              Conformance clauses for this MIB are defined such
              that implementation of this object is not required
              in a repeater system which does not support 100 Mb/s.
              However, repeater systems with mixed 10 and 100 Mb/s ports
              may implement this object across all ports,
              including 10 Mb/s. If this object is implemented, the
              value shall be a valid count as defined
              in the first paragraph of this description.

              A discontinuity may occur in the value
```

```
                    when the value of object
                    rptrMonitorPortLastChange changes."
          ::= { rptrMonitor100PortEntry 3 }

    rptrMonitorPortHCReadableOctets OBJECT-TYPE
        SYNTAX       Counter64
        MAX-ACCESS   read-only
        STATUS       current
        DESCRIPTION
                    "This object is the number of octets contained in
                    valid frames that have been received on this port.
                    This counter is incremented by OctetCount for each
                    frame received on this port which has been
                    determined to be a readable frame (i.e., including
                    FCS octets but excluding framing bits and dribble
                    bits).

                    This statistic provides an indicator of the total
                    data transferred.

                    This counter is a 64-bit version of rptrMonitor-
                    PortReadableOctets. It should be used by network
                    management protocols which suppport 64-bit counters
                    (e.g. SNMPv2).

                    Conformance clauses for this MIB are defined such
                    that implementation of this object is not required
                    in a repeater system which does not support 100 Mb/s.
                    However, repeater systems with mixed 10 and 100 Mb/s ports
                    may implement this object across all ports,
                    including 10 Mb/s. If this object is implemented, the
                    value shall be a valid count as defined
                    in the first paragraph of this description.

                    A discontinuity may occur in the value
                    when the value of object
                    rptrMonitorPortLastChange changes."

        DESCRIPTION
                "The number of frames of valid frame length
                that have been received on the ports in this repeater
                and for which the FCSError and CollisionEvent
                signals were not asserted. If an implementation
                can not obtain a count of frames as seen by
                the repeater itself, this counter may be
```

```
                implemented as the summation of the values of the
                rptrMonitorPortReadableFrames counters for all of
                the ports in the repeater.

                This statistic provides one of the parameters
                necessary for obtaining the packet error rate.
                The approximate minimum time for rollover of this
                counter is 80 hours in a 10 Mb/s repeater."
        ::= { rptrMonEntry 3 }

    rptrMonTotalErrors OBJECT-TYPE
        SYNTAX      Counter32
        MAX-ACCESS  read-only
        STATUS      current
        DESCRIPTION
                "The total number of errors which have occurred on
                all of the ports in this repeater. The errors
                included in this count are the same as those listed
                for the rptrMonitorPortTotalErrors counter. If an
                implementation can not obtain a count of these
                errors as seen by the repeater itself, this counter
                may be implemented as the summation of the values of
                the rptrMonitorPortTotalErrors counters for all of
                the ports in the repeater."
        ::= { rptrMonEntry 4 }

    rptrMonTotalOctets OBJECT-TYPE
        SYNTAX      Counter32
        MAX-ACCESS  read-only
        STATUS      current
        DESCRIPTION
                "The total number of octets contained in the valid
                frames that have been received on the ports in
                this group. If an implementation can not obtain
                a count of octets as seen by the repeater itself,
                this counter may be the summation of the
                values of the rptrMonitorPortReadableOctets
                counters for all of the ports in the group.

                This statistic provides an indicator of the total
                data transferred. The approximate minimum time
                for rollover of this counter in a 10 Mb/s repeater
                is 58 minutes divided by the number of ports in
                the repeater.

                For 100 Mb/s repeaters processing traffic at a
                maximum rate, this counter can roll over in less
                than 6 minutes divided by the number of ports in
                the repeater. Since that amount of time could
                be less than a management station's poll cycle
                time, in order to avoid a loss of information a
                management station is advised to also poll the
                rptrMonUpper32TotalOctets object, or to use the
                64-bit counter defined by rptrMonHCTotalOctets
                instead of the two 32-bit counters."

  rptrAddrSearchTable OBJECT-TYPE
       SYNTAX      SEQUENCE OF RptrAddrSearchEntry
       MAX-ACCESS not-accessible
       STATUS      current
       DESCRIPTION
               "This table contains one entry per repeater in the
               repeater system. It defines objects which allow a network
               management application to instruct an agent to watch
               for a given MAC address and report which port it
               was seen on. Only one address search can be in
               progress on each repeater at any one time. Before
               starting an address search, a management application
               should obtain 'ownership' of the entry in
               rptrAddrSearchTable for the repeater that is to
               perform the search. This is accomplished with the
               rptrAddrSearchLock and rptrAddrSearchStatus as
               follows:

               try_again:
                   get(rptrAddrSearchLock, rptrAddrSearchStatus)
                   while (rptrAddrSearchStatus != notInUse)
                   {
                       /* Loop waiting for objects to be available*/
                       short delay
                       get(rptrAddrSearchLock, rptrAddrSearchStatus)
                   }

                   /* Try to claim map objects */
                   lock_value = rptrAddrSearchLock
                   if ( set(rptrAddrSearchLock = lock_value,
                           rptrAddrSearchStatus = inUse,
                           rptrAddrSearchOwner = 'my-IP-address)
                         == FAILURE)
                       /* Another manager got the lock */
                       goto try_again

                   /* I have the lock */
                   set (rptrAddrSearchAddress = <search target>)

                   wait for rptrAddrSearchState to change from none

                   if (rptrAddrSearchState == single)
                       get (rptrAddrSearchGroup, rptrAddrSearchPort)
                   /* release the lock, making sure not to overwrite
                      anyone else's lock */
                   set (rptrAddrSearchLock = lock_value+1,
                       rptrAddrSearchStatus = notInUse,
                       rptrAddrSearchOwner = '')

               A management station first retrieves the values of
               the appropriate instances of the rptrAddrSearchLock
               and rptrAddrSearchStatus objects, periodically
               repeating the retrieval if necessary, until the value
               of rptrAddrSearchStatus is 'notInUse'. The
               management station then tries to set the same
               instance of the rptrAddrSearchLock object to the
               value it just retrieved, the same instance of the
```

rptrAddrSearchStatus object to 'inUse', and the
corresponding instance of rptrAddrSearchOwner to a
value indicating itself. If the set operation
succeeds, then the management station has obtained
ownership of the rptrAddrSearchEntry, and the value
of rptrAddrSearchLock is incremented by the agent (as
per the semantics of TestAndIncr). Failure of the
set operation indicates that some other manager has
obtained ownership of the rptrAddrSearchEntry.

Once ownership is obtained, the management station
can proceed with the search operation. Note that the
agent will reset rptrAddrSearchStatus to 'notInUse'
if it has been in the 'inUse' state for an abnormally
long period of time, to prevent a misbehaving manager
from permanently locking the entry. It is suggested
that this timeout period be between one and five
minutes.

When the management station has completed its search
operation, it should free the entry by setting
the instance of the rptrAddrSearchLock object to the
previous value + 1, the instance of the
rptrAddrSearchStatus to 'notInUse', and the instance
of rptrAddrSearchOwner to a zero length string. This
is done to prevent overwriting another station's
lock."

        MAX-ACCESS   read-create
        STATUS       current
        DESCRIPTION
                "Identifies the repeater for which a top N report will
                be prepared (see rptrInfoId). If the value of this
                object is positive, only ports assigned to this repeater
                will be used to form the list in which to order the
                Top N table. If this value is zero, all ports will be
                eligible for inclusion on the list.

                The value of this object may not be modified if the
                associated rptrTopNPortRowStatus object is equal to
                active(1).
                If, for a particular row in this table, the repeater
                specified by the value of this object goes away (is
                removed from the rptrInfoTable) while the associated
                rptrTopNPortRowStatus object is equal to active(1),
                the row in this table is preserved by the agent but
                the value of rptrTopNPortRowStatus is changed to
                notInService(2), and the agent may time out the row
                if appropriate. If the specified repeater comes
                back (reappears in the rptrInfoTable) before the row
                has been timed out, the management station sets
                the value of the rptrTopNPortRowStatus object back
                to active(1) if desired (the agent doesn't do this
                automatically)."

            STATUS      current
            DESCRIPTION
                    "The monitored variable, which the rptrTopNPortRate
                    variable is based upon.

                    The value of this object may not be modified if
                    the associated rptrTopNPortRowStatus object has
                    a value of active(1)."
            ::= { rptrTopNPortControlEntry 3 }

    rptrTopNPortTimeRemaining OBJECT-TYPE
            SYNTAX      Integer32 (0..2147483647)
            MAX-ACCESS  read-create
            STATUS      current
            DESCRIPTION
                    "The number of seconds left in the report
                    currently being collected. When this object
                    is modified by the management station, a new
                    collection is started, possibly aborting a
                    currently running report. The new value is
                    used as the requested duration of this report,
                    which is loaded into the associated
                    rptrTopNPortDuration object.

                    When this object is set to a non-zero value,
                    any associated rptrTopNPortEntries shall be
                    made inaccessible by the agent. While the value
                    of this object is non-zero, it decrements by one
                    per second until it reaches zero. During this
                    time, all associated rptrTopNPortEntries shall
                    remain inaccessible. At the time that this object
                    decrements to zero, the report is made accessible
                    in the rptrTopNPortTable. Thus, the rptrTopNPort
                    table needs to be created only at the end of the
                    collection interval.

                    If the value of this object is set to zero
                    while the associated report is running, the
                    running report is aborted and no associated
                    rptrTopNPortEntries are created."

            ::= {ieee8023snmpDot3RptrMgt 0}

rptrInfoHealth NOTIFICATION-TYPE
    OBJECTS      { rptrInfoOperStatus }
    STATUS       current
    DESCRIPTION
            "In a repeater system containing multiple managed repeaters,
            the rptrInfoHealth notification conveys information
            related to the operational status of a repeater.
            It is sent either when the value of rptrInfoOperStatus
            changes, or upon completion of a non-disruptive test.

            The agent shall limit the generation of
            consecutive rptrInfoHealth notifications for
            the same repeater so that there is at least
            a five-second gap between notifications of this type.
            When notifications are throttled, they are dropped,
            not queued for sending at a future time. (Note
            that 'generating' a notification means sending
            to all configured recipients.)"
    REFERENCE
            "IEEE Std 802.3, 30.4.1.3.1, nRepeaterHealth
            notification."
    ::= { ieee8023snmpDot3RptrNotifications 4 }

rptrInfoResetEvent NOTIFICATION-TYPE
    OBJECTS      { rptrInfoOperStatus }
    STATUS       current
    DESCRIPTION
            "In a repeater system containing multiple managed
            repeaters, the rptrInfoResetEvent notification
            conveys information related to the operational
            status of a repeater. This notification is sent
            on completion of a repeater reset action. A
            repeater reset action is defined as a transition
            to the START state of Figure 9-2 in Clause 9 of
            IEEE Std 802.3, when triggered by a management
            command (e.g., an SNMP Set on the rptrInfoReset
            object).

            The agent shall limit the generation of
            consecutive rptrInfoResetEvent notifications for
            a single repeater so that there is at least
            a five-second gap between notifications of
            this type. When notifications are throttled,
            they are dropped, not queued for sending at
            a future time. (Note that 'generating' a
            notification means sending to all configured
            recipients.)

            The rptrInfoResetEvent is not sent when the
            agent restarts and sends an SNMP coldStart or
            warmStart trap. However, it is recommended that
            a repeater agent send the rptrInfoOperStatus
            object as an optional object with its coldStart
            and warmStart trap PDUs."

8. Ethernet data terminal equipment (DTE) power via medium dependent interface (MDI) MIB module

8.1 Introduction

This clause defines a portion of the Management Information Base (MIB) for use with SNMP. In particular, it defines a set of MIB objects to manage Power via MDI Power Sourcing Equipment (PSE).

8.2 Overview

IEEE Std 802.3 defines the hardware registers that will allow for management interfaces to be built for a powered Ethernet device. The MIB module defined in this clause extends the Ethernet-like interface MIB defined in Clause 10 with the management objects required for the management of the powered Ethernet devices and ports.

8.3 MIB structure

These MIB objects are categorized into three MIB groups.

The pethPsePortTable defines the objects used for configuring and describing the status of ports on a PSE device. Examples of PSE devices are Ethernet switches that support power Ethernet and mid-span boxes.

The pethMainPseObjects MIB group defines the management objects for a managed main power source in a PSE device. Ethernet switches are one example of boxes that would support these objects.

The pethNotificationControlTable includes objects that control the transmission of notifications from the agent to a management application.

8.4 Security considerations for Ethernet data terminal equipment (DTE) power via medium dependent interface (MDI) MIB module.

There are a number of management objects defined in this MIB module with a MAX-ACCESS clause of read-write. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

Setting the following object to incorrect values can result in improper operation of the PSE, including the possibility that the PD does not receive power from the PSE port:

— pethPsePortAdminEnable
— pethPsePortPowerPairs
— pethPsePortPowerPriority
— pethPsePortType

Setting the following objects to incorrect values can result in an excessive number of traps being sent to network management stations:

— pethMainPseUsageThreshold
— pethNotificationControlEnable

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. These are as follows:

— pethPsePortPowerPairsControlAbility
— pethPsePortPowerPriority
— pethPsePortPowerClassifications

It is thus important to control GET and/or NOTIFY access to these objects and possibly to encrypt their values when sending them over the network via SNMP.

8.5 MIB module definition

An ASCII text version of the MIB definition can be found at the following URL:[14]

http://www.ieee802.org/3/be/public/mib_modules/20110202/802dot3dot1C8mib.txt

9. Ethernet passive optical networks (EPON) MIB module

9.1 Overview

This clause defines a MIB module for use with SNMP to manage 1G-EPON interfaces for Ethernet Passive Optical Networks. The clause contains a list of management objects based on the attributes defined in the relevant parts of IEEE Std 802.3 Clause 30, referring to EPON.

9.1.1 EPON architecture highlights

9.1.1.1 Introduction

The EPON standard, now part of IEEE Std 802.3, defines the Physical Layer and Media Access Control sublayer of EPON interfaces. EPON is a variant of Gigabit Ethernet used in optical access. The Passive Optical Network (PON) is comprised of sections of single-mode fiber connected with passive optical splitter/coupler devices, forming a passive optical tree, as shown in Figure 9–1. Individual branches of the PON are terminated with the Optical Line Terminal (OLT) in the Central Office and Optical Network Units (ONUs) near the subscribers. ONUs can be located either in some remote location (e.g., basement in a multi-dwelling unit) or directly at the subscriber premises. Various types of Customer Premises Equipment (CPE) can be connected to ONUs or even integrated with such devices. Figure 9–1 presents an example PON topology.
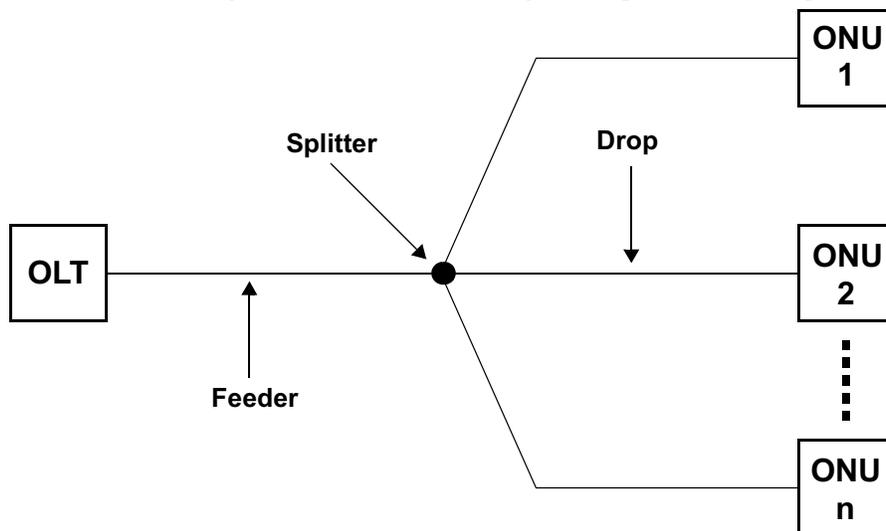

Figure 9–1—PON topology example

The IEEE layering architecture of an EPON interface is defined in the diagram of Figure 56–2 in IEEE Std 802.3. The following clauses in IEEE Std 802.3 define the corresponding layers of an EPON interface:

— Clause 30: Management
— Clause 60: PMD for EPON media (burst-mode PMD)
— Clause 64: MPCP (Multipoint Control Protocol), which defines the Multipoint architecture, and control protocol for the media access of EPON.
— Clause 65: Reconciliation Sublayer and Physical Coding Sublayer, which defines a number of extensions to standard Gigabit Ethernet PCS, i.e.,

    a)   Definition of Point-to-Point emulation function for EPON
    b)   Definition of the optional (frame-based) FEC for EPON
    c)   PMA for EPON

9.1.1.2 Principles of operation

The EPON interface specification extends the specification of Gigabit Ethernet as described in IEEE Std 802.3 Clause 35 and Clause 36. The Ethernet MAC operates at the data rate of 1 Gb/s and it is connected to media dependent interface through the GMII interface, as described in Clause 35. The EPON PCS layer extends the Gigabit Ethernet PCS as described in Clause 36. New, EPON-specific layers are added to Gigabit Ethernet layers in the following locations:

— MPCP is placed in the MAC control layer, providing EPON media access, station discovery, and registration protocol.

— Functionality of the reconciliation sublayer (RS) of Gigabit Ethernet was extended, creating logical links over shared passive optical medium, providing private transmission channels to each of the connected ONU.

— (Optional) FEC functionality located between the PCS and PMA layers was added, extending the Gigabit Ethernet PCS layer, enhancing reach and split performance of the EPON optical link.

Figure 9–2 presents the EPON layering model.

GMII = GIGABIT MEDIA INDEPENDENT INTERFACE
MDI = MEDIUM DEPENDENT INTERFACE
OAM = OPERATIONS, ADMINISTRATION & MAINTENANCE
OLT = OPTICAL LINE TERMINAL

ONU = OPTICAL NETWORK UNIT
PCS = PHYSICAL CODING SUBLAYER
PHY = PHYSICAL LAYER DEVICE
PMA = PHYSICAL MEDIUM ATTACHMENT
PMD = PHYSICAL MEDIUM DEPENDENT
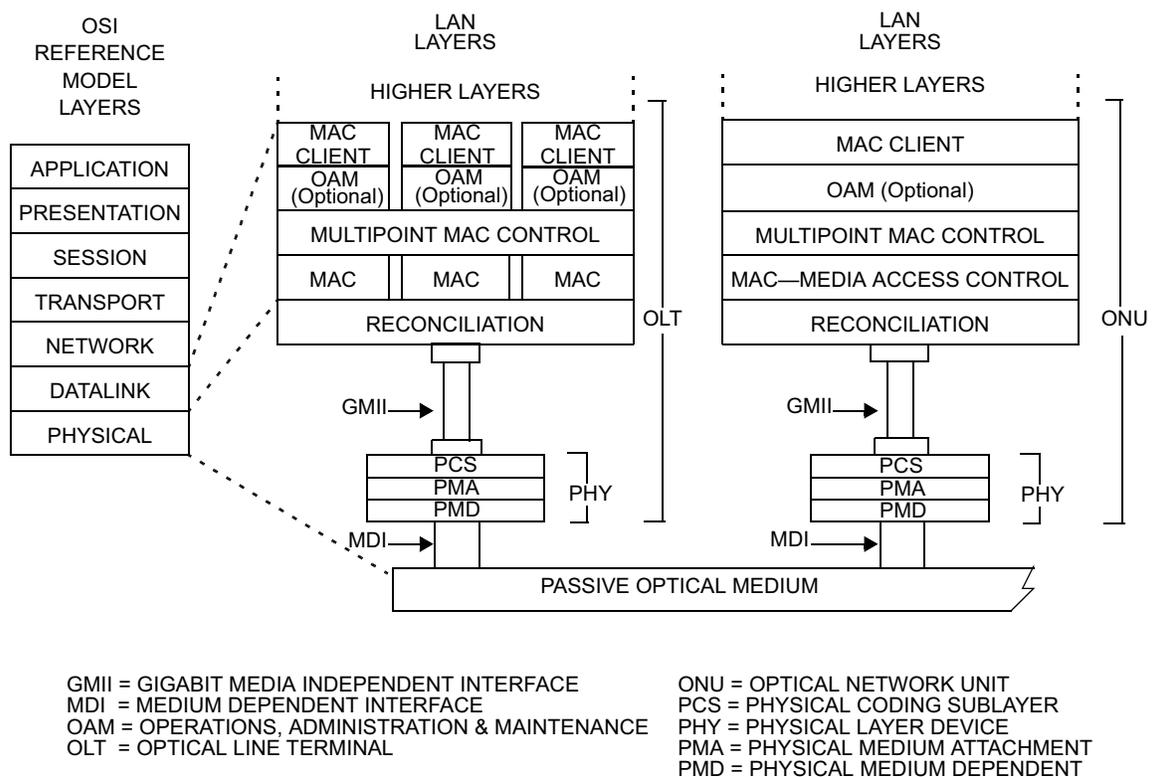

Figure 9–2—Relationship of Multipoint MAC control and the OSI protocol stack

9.1.1.3 Physical media

The physical link in EPON comprises single-mode fiber. The OLT and ONUs are connected through a passive optical network comprising sections of single-mode fiber interconnected with passive splitter/coupler devices.

The term *downstream* denotes transmission from the OLT to all connected ONUs, while the term *upstream* denotes transmission from the connected ONUs (one at the time) to the OLT. Upstream and downstream transmissions are wavelength division multiplexed (WDM) into a single strand of single-mode fiber, sharing the same physical link.

The downstream transmission channel is always available to the OLT, thus Time Division Multiplexing (TDM) is used. Transmissions from the OLT arrive at all of the connected ONUs and the individual ONUs filter data from the OLT's transmission based on the logical link identifiers (LLID) assigned to them during the registration and discovery process.

The upstream transmission channel is shared among a number of connected and registered ONUs using Time Division Multiple Access (TDMA). Access to upstream channel is controlled via the Multipoint Control Protocol (MPCP), where the OLT plays the role of the master and ONUs play the role of slave devices. An ONU upon registration remains silent until registered and once registered, it transmits data towards OLT only when granted a transmission opportunity (slot).

9.1.1.4 PMD specifications

The EPON PMD specifications are based on a wavelength plan similar to that used by ITU-T G.983.1. The OLT and ONU optical parameters were derived in part from earlier 1000 Mb/s Ethernet PMD specifications, with the addition of WDM capabilities, and burst mode operation for ONU transmitters and the OLT receiver.

The upstream burst mode operation capability corresponds directly to the TDMA operation in the upstream direction, where queued data is burst from individual ONUs at full data rate for the duration of the allocated transmission period. Once completed, the ONU goes silent and another ONU starts transmitting its data.

9.1.1.5 Point-to-point emulation

The downstream link is a broadcast medium, which means that all data transmitted by the OLT is received by all connected ONUs. In order to guarantee compliance of EPON with Ethernet architecture, the P2PE function was included in the RS, creating a series of logical links between the OLT and connected ONUs. An additional broadcast link is also provided for delivery of any broadcast content. In this way, EPON becomes a collection of logical P2P connections established between the OLT and the ONUs. Therefore, the OLT can be seen as an Ethernet device with N+1 logical ports (N P2P logical interfaces and 1 broadcast interface, where N designates the number of connected ONUs).

Logical links also provide a solution for privacy of data, which otherwise would be shared by all subscribers connected to a single OLT port. In this way, each subscriber is isolated and restricted to accessing data streams addressed only to that particular subscriber.

This concept is illustrated in Figure 9–3, which shows an example of an EPON with a single OLT and three connected ONUs.

The single copy broadcast channel (addressed with a special, reserved LLID, see IEEE Std 802.3 65.1.3.1) was added to take advantage of the broadcast transmission capability of the underlying physical medium. In this way, it is very simple and very bandwidth efficient to deliver broadcast content to all ONUs at the same time, avoiding the need to replicate data into a series of P2P links.

The ONUs filter all downstream data and drop all frames addressed to other devices. Only broadcast frames and frames with correct unicast logical link ID (LLID) are admitted and processed. The LLID replaces two octets of the Ethernet frame preamble, identifying a logical link established between the OLT and the given ONU during the discovery and registration process. The LLID indicates the destination port in the down-

stream and source port in the upstream. The logical links are used effectively to prevent EPON from violating the IEEE 802.1D bridging rules.

between an OLT and three ONUs**

9.1.1.6 Principles of the MPCP

The EPON standard comprises a mechanism for media access control, referred to as Multipoint Control Protocol (MPCP). An access network architecture is different from a typical LAN environment, primarily in terms of network provisioning. An access network is an administrated environment, with an operator providing services and subscribers consuming it depending on service provisioning contracts. The operator controls the network, manages traffic and medium access, and enforces the service level agreements (SLAs). For instance, the available bandwidth is controlled and subscribers may be billed for services. In this sense, the access network (and EPON specifically) requires a media access control protocol that provides mechanism for station discovery and registration as well as bandwidth provisioning capabilities.

In the MPCP, the OLT is considered to be the master, controlling a series of connected ONUs (slave devices). The OLT manages the network and controls access to network resources from individual slave devices. The MPCP is also used for provisioning upstream channel access to individual slave devices via a MPCPDU pair i.e., GATE and REPORT. The MPCP is part of the MAC control layer and MPCPDUs are considered MAC control messages, carrying a specific Ethertype of 0x8808. These messages are not forwarded outside of the EPON domain and are used to manage the EPON link only.

A concept of time exists in the MPCP in order to schedule the upstream transmission. A timestamp, which is transmitted in the MPCPDUs downstream by the OLT and received by the connected ONUs, is used to synchronize slave devices to master device clock. This guarantees that upstream transmissions from individual ONUs arrive at the OLT at the precisely anticipated time, which in turn guarantees that data from different ONUs will not overlap.

The MPCP plane is also used to measure the round-trip time (RTT) for each connected ONU. Each MPCPDU carries a generalized timestamp field, which is filled in by the transmitting station with the current value of its MPCP clock at the time when the given MPCPDU is transmitted. The RTT is measured first during the discovery and registration process and then updated regularly upon each exchange of MPCPDUs between the OLT and one of the ONUs. RTT is used by the OLT bandwidth scheduler to schedule upstream transmission slots for individual ONUs in a non-overlapping manner. The IEEE 802.3 EPON standard provides support for the network diameter (distance between the OLT and the farthest ONU) of nominally up to 20 km, which corresponds to the RTT of approximately 200 µs. However, nothing in the standard precludes support for larger network diameters.

The TDMA control is performed using a pair of MPDPUs, namely GATE generated by the OLT to indicate a future transmission opportunity to an ONU and REPORT generated by the ONU with information on the current queue status (bandwidth demand). Internal structure and possible encoding of GATE and REPORT MPCPDUs are defined in Clause 64 of IEEE Std 802.3.

A scheduling algorithm at the OLT, which is not defined in IEEE Std 802.3, is responsible for dividing the bandwidth and controlling the transmission delay of each ONU according to its SLA. The MPCP defines a closed loop operation in order for this algorithm to be efficient. The MPCP allows the ONUs to report on the amount of bandwidth they require for transmission using a special REPORT message. This allows allocating bandwidth to an ONU only when requested, relying on the statistical burst property of the traffic, and allowing different peak bandwidths for different ONUs at different times; hence, allowing oversubscription of the bandwidth. The REPORT message reports the amount of data waiting in the ONU queues.

In addition, the MPCP defines a protocol of auto-discovery and registration of ONUs.

The MPCP registration process is presented in Figure 9–4, while details are described in Clause 64 of IEEE Std 802.3.
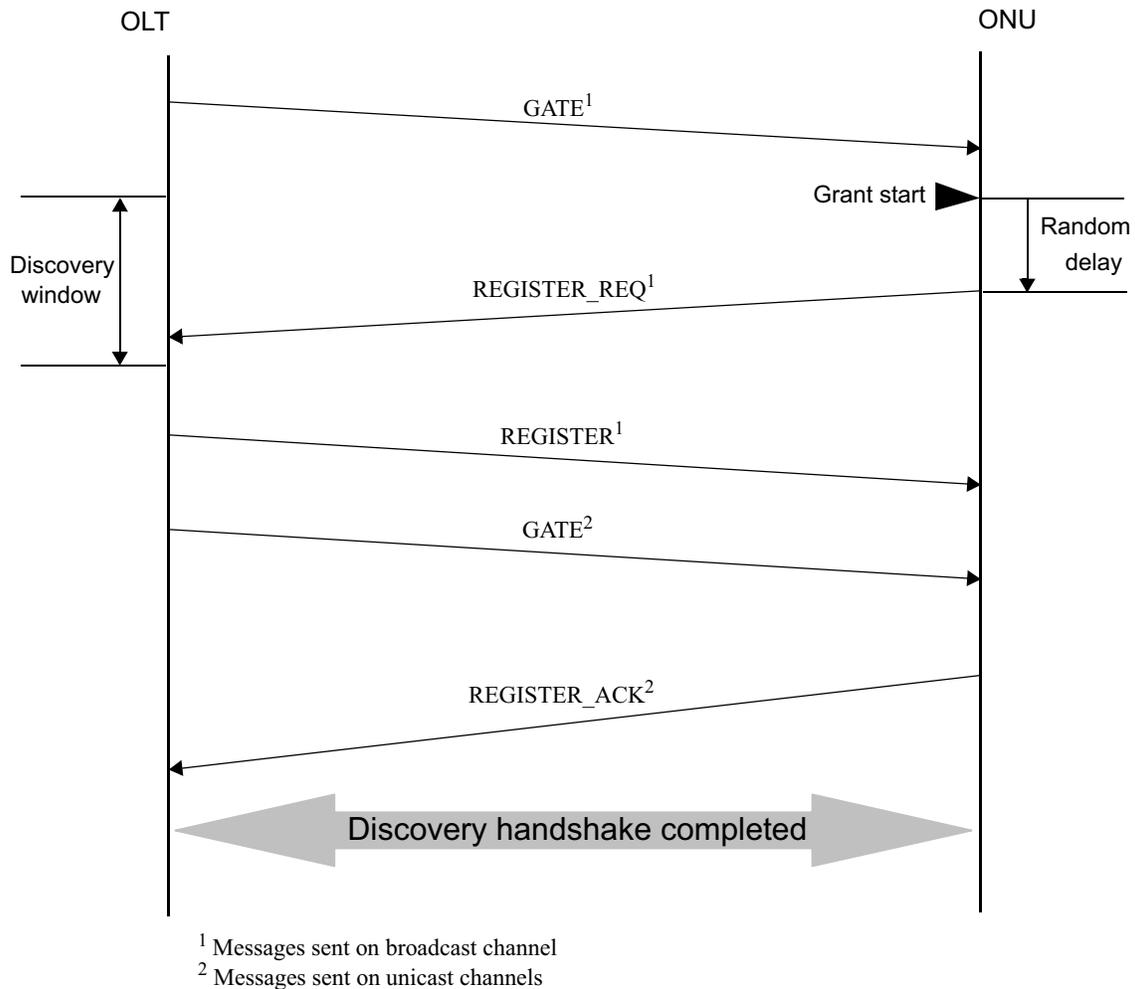

Figure 9–4—Discovery handshake message exchange

A new ONU requests to register during a special upstream window (called Discovery Window), sending the REGISTER_REQ MPCPDU. More than one ONU may attempt registration during that window, which means that their REGISTER_REQ MPCPDUs can potentially collide at the OLT receiver, since the ONU-specific RTT is not yet known and transmissions from individual ONUs cannot be scheduled in an non-overlapping manner. A random backoff mechanism was therefore developed and is used to increase the registration success probability.

When the OLT receives a REGISTER_REQ MPCPDU from an ONU, decision on registration is taken and an LLID is assigned to that ONU. Next, the OLT sends a REGISTER MPCPDU to that ONU, informing the given slave device whether it is admitted to network or not. The registration process is completed with the ONU sending REGISTER_ACK MPCPDU to the OLT, confirming assigned parameters and registration in the network. From that point onward, the OLT can schedule transmissions from that ONU using its LLID, using the measured RTT to guarantee that its transmissions do not collide with other ONUs.

Additional higher layer protocols may be employed to authenticate the ONU and allow it to participate in the network; however, their specification is outside the scope of IEEE Std 802.3.

9.1.1.7 Forward error correction (FEC)

The optional FEC mechanism is defined to enhance the EPON link budget. All the passive components of the fiber plant attenuate the optical signal, thus the target distance (network diameter) and the number of supported splits is limited by the available link budget. The optional FEC mechanism increases the available link budget by improving the link BER from 10^{-4} to 10^{-12} (the target BER at the MAC), effectively increasing the target network diameter and/or split ratio. The target use of the increased power budget remains at the sole discretion of the network architects and is out of the scope of IEEE Std 802.3.

The optional FEC used in EPON is frame-based, meaning that parity information is added at the end of each Ethernet packet. Extra space between individual Ethernet packets is guaranteed by the MAC rate adaptation function, while extra idle symbols were replaced within the FEC function.

The start and end of packet codewords also define the FEC boundaries, and they are outside the FEC protection. They are replaced by a series of symbols to reduce their vulnerability to link errors.

Figure 9–5 presents the structure of an FEC-protected EPON frame.

The optional FEC function is added to the extended Gigabit Ethernet PCS per 65.2 in IEEE Std 802.3. The added, optional FEC function introduces a fixed delay in receive path and transmit path.

| S_FEC | Preamble/SFD | Frame | FCS | T_FEC | Parity | T_FEC |

Figure 9–5—FEC-protected frame

9.1.2 Management architecture

All of the EPON layers are accompanied by a management interface that is controlled through mechanisms defined in Clause 30 of IEEE Std 802.3. Since IEEE Std 802.3 specifications may be used for different applications (and hence are extensible), and some of the clauses may be used separately, the management clause allocates a separate package for each independent layer. The structure of the MIB modules follows this separation.

Figure 9–6 presents the relation of the MIB module groups to the individual IEEE Std 802.3 layers.

The association is straightforward for the ONU interface. There is one logical and one physical interface, and a single copy of each layer can be remotely queried by the OLT.

The OLT has a single physical interface and N logical interfaces, one for each logical link connected to an ONU. There is also one logical interface for the single copy broadcast link. Per layering diagram in Figure 9–6, the MAC sublayer is virtually replicated. Therefore, in this clause it was elected that management of logical interfaces is performed in the manner identical to management of any physical interfaces—an interface index is allocated for each one of the logical links, and an additional interface index is allocated for the OLT.

For each physical interface, there would be an entry (ifIndex) in the tables of the interface MIB module defined in IETF RFC 2863, the MAU MIB module defined in Clause 13, and the Ethernet-like MIB module defined in Clause 10. Additionally, there would be entries (ifIndexes) for the virtual interfaces of the OLT interface. The justification for the additional allocation of indexes is that the virtual interfaces are quite well
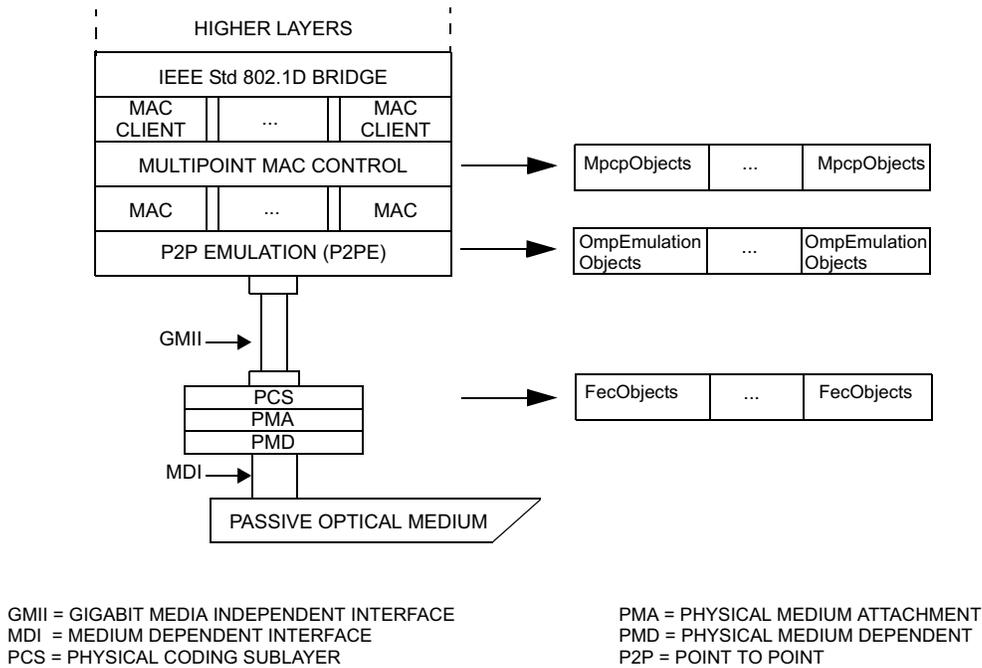

Figure 9–6—Relationship of the MIB groups to the EPON sublayers

distinguished, as they connect different physical ONUs from the OLT side. For instance, there is a meaning for separate bad frames counter or bad octets counter for each virtual link, as the ONUs can be differently distanced. This is quite similar to a case of separate physical interfaces.

The same partition concept exists for the MIB module of this clause. Each row in the tables are indexed according to the ifIndex; specifically, there is a row for each virtual link. There are some control objects that are shared and are the same for the virtual interfaces (and they should have the same value for each ifIndex), but most of the objects have different values for N+1 logical interfaces at the OLT. This is done for each MIB group. It is different from the EPON layering diagram, which presents the P2MP layer as a single layer, while duplicating the MAC and MAC client layers (please see Figure 9–6). However, from a management perspective, it is more convenient to partition the management of the layers for the virtual links, as the atomic managed entity is the virtual link. It is also convenient to use the interface index of the virtual link for that purpose, as it is already used to index the rows of the virtual links at the Interface, MAU, and Ethernet-like interface MIBs.

9.2 MIB structure

This subclause defines the DOT3 EPON MIB module. The DOT3 EPON MIB module defines the objects used for management of the IEEE Std 802.3 EPON interfaces. These MIB objects are included in the following four groups.

a) MPCP MIB objects—MIB objects related to IEEE Std 802.3, Clause 64, Multipoint Control Protocol attributes. The following tables are presented in this group:
    1) The dot3MpcpControlTable defines the objects used for the configuration and status indication, which are per logical link, of MPCP compliant interfaces.

    2)   The dot3MpcpStatTable defines the statistics objects that are per logical link, of MPCP compliant interfaces.

    3)   The operational mode of an OLT/ONU for the tables is defined by the dot3MpcpMode object in the dot3MpcpControlTable.

b)   The OMPEmulation MIB objects—MIB objects related to IEEE Std 802.3, Clause 65, point-to-point emulation attributes. The following tables are presented in this group:

    1)   The dot3OmpEmulationTable defines the objects used for the configuration and status indication, which are per logical links, of OMPEmulation compliant interfaces.

    2)   The dot3OmpEmulationStatTable defines the statistics objects that are per logical link, of OMPEmulation compliant interfaces.

    3)   The operational mode of an OLT/ONU for the tables is defined by the dot3OmpEmulationType object in the dot3OmpEmulationTable.

c)   The FEC MIB objects—MIB objects related to IEEE Std 802.3, Clause 60 and Clause 65, EPON FEC attributes. The following table is presented in this group:

    1)   The dot3EponFecTable defines the objects used for the configuration and status indication, which are per logical link, of FEC EPON compliant interfaces.

d)   The EPON extended package MIB objects—MIB objects used for configuration and status indication with extended capabilities of the EPON interfaces. The following tables are presented in this group:

    1)   The dot3ExtPkgControlTable defines the objects, which are per logical link, used for the configuration and status indication of EPON compliant interfaces.

    2)   The dot3ExtPkgQueueTable defines the objects, which are per logical link, and per queue, used for the configuration and status indication of the ONU queues reported in the MPCP REPORT message, of EPON compliant interfaces.

    3)   The dot3ExtPkgQueueSetsTable defines the objects, which are per logical link, per queue, and per queue_set, used for the configuration and status indication of the ONU queue_sets reported in the MPCP REPORT message, of EPON compliant interfaces.

    4)   The dot3ExtPkgOptIfTable defines the objects, which are per logical link, used for the control and status indication of the optical interface of EPON compliant interfaces.

The interface MIB module defined in IETF RFC 2863 defines the interface index (ifIndex). Interface Index, as specified in IETF RFC 2863, is used in this MIB module as an index to the EPON MIB tables. The ifIndex is used to denote the physical interface and the virtual link interfaces at the OLT. The OLT interface and the virtual link interfaces are stacked using the ifStack table defined in IETF RFC 2863, and the ifInvStack defined in IETF RFC 2864. The OLT interface is the lower layer of all other interfaces associated with the virtual links.

As described in 9.1.2, each row in the tables is indexed according to the ifIndex; specifically, there is a row for each virtual link. There are a few control objects that are shared and have the same value for the virtual interfaces (and they should have the same value for each ifIndex), but most of the objects have different values for N+1 logical interfaces at the OLT. This is done for each MIB group. It is a bit different from the EPON layering diagram, which presents the P2MP layer as a single layer while duplicating the MAC and MAC client layers. However, from a management perspective, it is more convenient to partition the management of the layers for the virtual links, as the atomic managed entity is the virtual link. It is also convenient to use the interface index of the virtual link for that purpose, as it is already used to index the rows of the virtual links at the Interface, MAU, and Ethernet-like interface MIB modules.

The creation of the rows of the ONU interface is done at initialization. Table 9–1 presents the MPCP control table of ONU1 after initialization. A single row exists in the table.

Table 9–2 presents the MPCP control table of ONU1 in working mode. A single row exists in the table.

Table 9–1—MPCP control table of ONU1 after initialization

MPCP control MIB object	Value
ifIndex	100
dot3MpcpOperStatus	true
dot3MpcpAdminState	true
dot3MpcpMode	onu
dot3MpcpSyncTime	0
dot3MpcpLinkID	0
dot3MpcpRemoteMACAddress	00:00:00:00:00:00
dot3MpcpRegistrationState	unregistered
dot3MpcpTransmitElapsed	0
dot3MpcpReceiveElapsed	0
dot3MpcpRoundTripTime	0

Table 9–2—MPCP control table of ONU1 in working mode

MPCP control MIB object	Value
ifIndex	100
dot3MpcpOperStatus	true
dot3MpcpAdminState	true
dot3MpcpMode	onu
dot3MpcpSyncTime	25
dot3MpcpLinkID	1
dot3MpcpRemoteMACAddress	OLT_MAC_Address[a]
dot3MpcpRegistrationState	registered
dot3MpcpTransmitElapsed	10
dot3MpcpReceiveElapsed	10
dot3MpcpRoundTripTime	100

[a]OLT_MAC_Address is the MAC address of the OLT EPON interface.

The creation of the rows of the OLT interface and the broadcast virtual interface is done at initialization.

The creation of rows of the virtual interfaces at the OLT is done when the link is established (ONU registers) and the deletion is done when the link is deleted (ONU deregisters).

Table 9–3 presents the MPCP control table of the OLT after initialization, before the ONUs register. A single row exists in this table associated with the virtual broadcast link.

Table 9–3—MPCP control table of the OLT after initialization

MPCP control MIB object	Value
ifIndex	165535
dot3MpcpOperStatus	true
dot3MpcpAdminState	true
dot3MpcpMode	olt
dot3MpcpSyncTime	25
dot3MpcpLinkID	65535
dot3MpcpRemoteMACAddress	BRCT_MAC_Address[a]
dot3MpcpRegistrationState	registered
dot3MpcpTransmitElapsed	10
dot3MpcpReceiveElapsed	100000
dot3MpcpRoundTripTime	0

[a]BRCT_MAC_Address is the MAC address of the broadcast EPON interface, which is the OLT MAC address.

Table 9–4 presents the MPCP control table of the OLT in working mode. Three rows exist in the table associated with the virtual links.

Table 9–4—MPCP control table of the OLT in working mode

MPCP control MIB object	Value	Value	Value
ifIndex	100001	100002	165535
dot3MpcpOperStatus	true	true	true
dot3MpcpAdminState	true	true	true
dot3MpcpMode	olt	olt	olt
dot3MpcpSyncTime	25	25	25

Table 9–4—MPCP control table of the OLT in working mode *(continued)*

MPCP control MIB object	Value	Value	Value
dot3MpcpLinkID	1	2	65535
dot3MpcpRemote MACAddress	ONU1_MAC_Address[a]	ONU2_MAC_Address[b]	BRCT_MAC_Address[c]
dot3MpcpRegistrationState	registered	registered	registered
dot3MpcpTransmitElapsed	10	10	10
dot3MpcpReceiveElapsed	10	10	10
dot3MpcpRoundTripTime	100	60	0

[a]ONU1_MAC_Address is the MAC address of ONU1 EPON interface.
[b]ONU2_MAC_Address is the MAC address of ONU2 EPON interface.
[c]BRCT_MAC_Address is the MAC address of the broadcast EPON interface, which is the OLT MAC address.

9.3 Relationship to other MIB modules

9.3.1 Relation to the Interfaces Group MIB and Ethernet-like interface MIB

This MIB module extends the objects of the Interfaces Group MIB and the Ethernet-like interface MIB for the EPON type interface. Therefore, if this module is implemented, the Interfaces Group MIB module defined in IETF RFC 2863 and the Ethernet-like interface MIB module defined in Clause 10 shall also be implemented.

Thus, each managed EPON interface would have a corresponding entry in the mandatory tables of the Ethernet-like MIB module found in Clause 10, and likewise in the tables of the Interfaces Group MIB module found in IETF RFC 2863. Also, each managed virtual EPON interface would have a corresponding entry in the mandatory tables of the Ethernet-like MIB module found in Clause 10, and likewise in the tables of the Interfaces Group MIB module found in IETF RFC 2863 with a dedicated ifIndex for this interface.

In this clause, there is no replication of the objects from these MIBs. Therefore, for instance, the clause is defining dot3MpcpRemoteMACAddress only while assuming that the local MAC address object is already defined in Clause 10.

This clause defines the specific EPON objects of an ONU interface and an OLT interface. Information in the tables is per LLID. The rows in the EPON MIB tables referring to the LLIDs are denoted with the corresponding ifIndexes of the virtual link interfaces.

Note that all virtual interfaces have the same physical MAC address at the OLT, since the physical OLT interface used by all virtual interfaces is the same. The value of this physical MAC interface is specified in 64.1.2 of IEEE Std 802.3. The corresponding object of the Ethernet-like interface MIB is replicated for all the virtual interfaces.

For example, the values of the Interfaces Group MIB objects are presented in the following tables, for an OLT with three registered ONUs

Table 9–5 presents the objects of the Interfaces Group MIB of an ONU in working mode.

Table 9–5—Interfaces Group MIB of an ONU in working mode

Interfaces Group MIB object	Value
ifIndex	1
ifDescr	"interface description"
ifType	ethernetCsmacd (6) 1000base-Px
ifMtu	MTU size (1522)
ifSpeed	1000000000
ifPhysAddress	ONU_MAC_Address[a]
ifAdminStatus	up
ifOperStatus	Up
ifLastChange	ONUup_time
ifInOctets	ONU_octets_number
ifInUcastPkts	ONU_unicast_frame_number
ifInNUcastPkts	ONU_non_unicast_frame_number
ifInDiscards	ONU_discard_frame_number

ifOutNUcastPkts	ONU1_non_unic_frame_num	ONU2_non_unic_frame_num	BRCT_non_unic_frame_num

Table 9–8—Interfaces Group MIB objects of an OLT interface, associated with the virtual link interfaces *(continued)*

Interface MIB object	Value	Value	Value
ifOutDiscards	ONU1_disc_frame_num	ONU2_disc_frame_num	BRCT_disc_frame_num
ifOutErrors	ONU1_err_frame_num	ONU2_err_frame_num	BRCT_err_frame_num
ifOutQLen	ONU1_queue_frame_num	ONU2_queue_frame_num	BRCt_queue_frame_num

[a]OLT_MAC_Address is the MAC address of the OLT EPON interface.

The following values will be set in the ifStack and ifInvStack tables related to this example:

ifStackTable:

— ifStackHigherLayer = 265535, ifStackLowerLayer = 2 – map between the OLT physical interface and its broadcast virtual interface

— ifStackHigherLayer = 200001, ifStackLowerLayer = 2 – map between the OLT physical interface and its virtual interface of the 1st ONU

— ifStackHigherLayer = 200002, ifStackLowerLayer = 2 – map between the OLT physical interface and its virtual interface of the 2nd ONU

— ifStackHigherLayer = 200003, ifStackLowerLayer = 2 – map between the OLT physical interface and its virtual interface of the 3rd ONU

ifInvStackTable:

— ifStackLowerLayer = 2, ifStackHigherLayer = 265535 – map between the broadcast interface of the OLT and the OLT physical interface

— ifStackLowerLayer = 2, ifStackHigherLayer = 200001 – map between the OLT virtual interface of the 1st ONU and the OLT physical interface

— ifStackLowerLayer = 2, ifStackHigherLayer = 200002 – map between the OLT virtual interface of the 2nd ONU and the OLT physical interface

— ifStackLowerLayer = 2, ifStackHigherLayer = 200003 – map between the OLT virtual interface of the 3rd ONU and the OLT physical interface

The rows for the ONU interface, the OLT interface, and the OLT broadcast interface are created in initialization. The creation of a row for a virtual link is done when the virtual link is established (ONU registers), and deletion is done when the virtual link is deleted (ONU deregisters).

The EPON MIB module also extends the Interfaces Group MIB module with a set of counters, which are specific for the EPON interface. The EPON MIB module implements the same handling of the counters when the operation of the interface starts or stops. The interface MIB clause describes the possible behavior of counters when an interface is re-initialized using the ifCounterDiscontinuityTime indicator, indicating the discontinuity of the counters. See IETF RFC 2863, Section 3.1.5, for more information. The counters of the EPON MIB should be handled in a similar manner.

9.3.2 Relation to the IEEE 802.3 MAU MIBs

The MAU types of the EPON Interface are defined in the Clause 13. This clause assumes the implementation of the MAU MIB for this purpose and does not repeat the EPON MAU types. Therefore, if this module is implemented, the MAU-MIB module defined in Clause 13 shall also be implemented.

The handling of the ifMAU tables for the EPON case is similar to the handling described in the former subclause for the Interface and Ethernet-like interface MIBs. A single row exists for the ONU in the ifMauTable. A row for each virtual link (N+1 rows) exists at the OLT, with a separate value of ifMauIfIndex for each virtual link.

As specified above, the rows for the ONU interface, the OLT interface, and the OLT broadcast interface are created in initialization. The creation of a row for a virtual link is done when the virtual link is established (ONU registers), and deletion is done when the virtual link is deleted (ONU deregisters).

9.3.3 Relation to the Ethernet OAM MIB

The EPON interfaces are intended for use in optical subscriber access networks and most probably will be accompanied with the implementation of the OAM protocol defined in Clause 57 of IEEE Std 802.3. Therefore, the Ethernet OAM MIB module defined in Clause 6 may be implemented when this MIB module is implemented defining managed objects for the OAM protocol that are complementary to the EPON MIB module.

9.3.4 Relation to the bridge MIB

It is very probable that an EPON OLT will implement a bridging functionality above the EPON interface layer, bridging between the EPON users and the network. Bridge functionality is specified in IEEE Std 802.1D. In this scenario, the virtual ports of the EPON are corresponding to the virtual bridge ports. There is a direct mapping between the bridge ports and the LLIDs, which are virtual EPON channels.

Therefore, the bridge MIB modules defined in IEEE Std 802.1Q [B4] may be implemented when the EPON MIB module is implemented for an EPON OLT, defining managed objects for the bridge layer.

The values of dot1dBasePortIfIndex would correspond to the ifIndex of the virtual port (1 for LLID1, 2 for LLID2, etc.).

The broadcast virtual EPON interface of the OLT has no direct mapping to a virtual bridge port as it is not port specific but used for broadcast traffic.

9.4 Mapping of IEEE 802.3 managed objects

This subclause contains the mapping between the managed objects defined in this clause and the attributes defined in IEEE Std 802.3 Clause 30. Table 9–9 provides the mapping between the dot3EPON MIB module MPCP objects and the IEEE Std 802.3 Clause 30 MPCP attributes.

Table 9–10 provides the mapping between the dot3EPON MIB module OMPEmulation objects and IEEE Std 802.3 Clause 30 OMPE attributes.

Table 9–11 provides the mapping between the dot3EPON MIB module FEC objects and IEEE Std 802.3 Clause 30 MAU attributes.

9.5 Security considerations for Ethernet passive optical networks (EPON) MIB module

There are number of managed objects defined in this MIB module that have a MAX-ACCESS clause of read-write or read-create. Writing to these objects can have potentially disruptive effects on network operation, including those listed in 9.5.1 to 9.5.13.

9.5.1 dot3MpcpAdminState

Changing dot3MpcpAdminState state can lead to disabling the Multipoint Control Protocol on the respective interface, leading to the interruption of service for the users connected to the respective EPON interface.

9.5.2 dot3EponFecMode

Changing dot3EponFecMode state can lead to disabling the Forward Error Correction on the respective interface, which can lead to a degradation of the optical link, and therefore may lead to an interruption of service for the users connected to the respective EPON interface.

9.5.3 dot3ExtPkgObjectReset

Changing dot3ExtPkgObjectReset state can lead to a reset of the respective interface leading to an interruption of service for the users connected to the respective EPON interface.

9.5.4 dot3ExtPkgObjectPowerDown

Changing dot3ExtPkgObjectPowerDown state can lead to a power down of the respective interface, leading to an interruption of service for the users connected to the respective EPON interface.

9.5.5 dot3ExtPkgObjectFecEnabled

Changing dot3ExtPkgObjectFecEnabled state can lead to disabling the Forward Error Correction on the respective interface, which can lead to a degradation of the optical link, and therefore may lead to an interruption of service for the users connected to the respective EPON interface.

9.5.6 dot3ExtPkgObjectRegisterAction

Changing dot3ExtPkgObjectRegisterAction state can lead to a change in the registration state of the respective interface, leading to a deregistration and an interruption of service for the users connected to the respective EPON interface.

9.5.7 dot3ExtPkgObjectReportNumThreshold

Changing dot3ExtPkgObjectReportNumThreshold can lead to a change in the reporting of the ONU interface and therefore to a change in the bandwidth allocation of the respective interface. This change may lead to a degradation or an interruption of service for the users connected to the respective EPON interface.

9.5.8 dot3ExtPkgObjectReportThreshold

Changing dot3ExtPkgObjectReportThreshold can lead to a change in the reporting of the ONU interface and therefore to a change in the bandwidth allocation of the respective interface. This change may lead to a degradation or an interruption of service for the users connected to the respective EPON interface.

9.5.9 dot3ExtPkgOptIfLowerInputPowerThreshold

Changing dot3ExtPkgOptIfLowerInputPowerThreshold can lead to a Threshold Crossing Alert (TCA) being sent for the respective interface. This alert may be leading to an interruption of service for the users connected to the respective EPON interface, depending on the system action on such an alert.

9.5.10 dot3ExtPkgOptIfUpperInputPowerThreshold

Changing dot3ExtPkgOptIfUpperInputPowerThreshold can lead to a Threshold Crossing Alert (TCA) being sent for the respective interface. This alert may be leading to an interruption of service for the users connected to the respective EPON interface, depending on the system action on such an alert.

9.5.11 dot3ExtPkgOptIfLowerOutputPowerThreshold

Changing dot3ExtPkgOptIfLowerOutputPowerThreshold can lead to a Threshold Crossing Alert (TCA) being sent for the respective interface. This alert may be leading to an interruption of service for the users connected to the respective EPON interface, depending on the system action on such an alert.

9.5.12 dot3ExtPkgOptIfUpperOutputPowerThreshold

Changing dot3ExtPkgOptIfUpperOutputPowerThreshold can lead to a Threshold Crossing Alert (TCA) being sent for the respective interface. This alert may be leading to an interruption of service for the users connected to the respective EPON interface, depending on the system action on such an alert.

9.5.13 dot3ExtPkgOptIfTransmitEnable

9.6 Changing dot3ExtPkgOptIfTransmitEnable state can lead to a halt in the optical transmission of the respective interface, leading to an interruption of service for the users connected to the respective EPON interface.**MIB module definition**

    DESCRIPTION
            "The objects in this MIB module are used to manage the
             Ethernet in the First Mile (EFM) Ethernet Passive Optical
             Network (EPON) Interfaces as defined in IEEE Std 802.3
             Clauses 60, 64, and 65.

             Of particular interest are Clause 64 (Multi-Point Control
             Protocol - MPCP), Clause 65 (Point-to-Multipoint
             Reconciliation Sublayer - P2MP RS), Clause 60 (Ethernet
             Passive Optical Network Physical Medium Dependent - EPON
             PMDs), Clause 30, 'Management', and Clause 45, 'Management
             Data Input/Output (MDIO) Interface'."

    DESCRIPTION
            "A Table of dot3 Multi-Point Control Protocol (MPCP)
             MIB objects. The entries in the table are control and
             status objects of the MPCP.
             Each object has a row for every virtual link denoted by
             the corresponding ifIndex.
             The LLID field, as defined in the IEEE Std 802.3, is a 2-byte
             register (15-bit field and a broadcast bit) limiting the
             number of virtual links to 32768. Typically the number
             of expected virtual links in a PON is like the number of
             ONUs, which is 32-64, plus an additional entry for
             broadcast LLID."
    ::= { dot3EponMpcpObjects 1 }

dot3MpcpControlEntry OBJECT-TYPE
    SYNTAX  Dot3MpcpControlEntry
    MAX-ACCESS  not-accessible
    STATUS  current
    DESCRIPTION
            "An entry in the dot3 MPCP Control table.
             Rows exist for an OLT interface and an ONU interface.
             A row in the table is denoted by the ifIndex of the link
             and it is created when the ifIndex is created.
             The rows in the table for an ONU interface are created
             at system initialization.
             The row in the table corresponding to the OLT ifIndex
             and the row corresponding to the broadcast virtual link
             are created at system initialization.
             A row in the table corresponding to the ifIndex of a
             virtual links is created when a virtual link is
             established (ONU registers) and deleted when the virtual
             link is deleted (ONU deregisters)."

         DESCRIPTION
                    "This object is used to define the admin state of the
                    Multi-Point MAC Control sublayer, as defined in
                    IEEE Std 802.3, Clause 64, and to reflect its state.
                    When selecting the value as true(1), the Multi-Point
                    Control Protocol of the interface is enabled.
                    When selecting the value as false(2), the Multi-Point
                    Control Protocol of the interface is disabled.
                    This object reflects the administrative state of the
                    Multi-Point Control Protocol of the interface.
                    The write operation is not restricted in this document
                    and can be done at any time. Changing
                    dot3MpcpAdminState state can lead to disabling the
                    Multi-Point Control Protocol on the respective interface,
                    leading to the interruption of service for the users
                    connected to the respective EPON interface.
                    This object is applicable for an OLT, with the same
                    value for all virtual interfaces, and for an ONU."

    STATUS  current
    DESCRIPTION
            "An object that identifies the source_address
             parameter of the last MPCPDUs passed to the MAC Control.
             This value is updated on reception of a valid frame with
             1) a destination Field equal to the reserved multicast
             address for MAC Control as specified in [802.3], Annex
             31A; 2) the lengthOrType field value equal to the reserved
             Type for MAC Control as specified in [802.3], Annex
             31A; 3) an MPCP subtype value equal to the subtype
             reserved for MPCP as specified in IEEE Std 802.3, Annex 31A.
             This object is applicable for an OLT and an ONU. At the
             OLT, it has a distinct value for each virtual interface.
             The value reflects the MAC address of the remote entity
             and therefore the OLT holds a value for each LLID, which
             is the MAC address of the ONU; the ONU has a single
             value that is the OLT MAC address."

                "An object that indicates the support of operation of the
                 optional FEC sublayer of the 1000BASE-PX PHY specified
                 in IEEE Std 802.3, 65.2.
                 unknown(1) value is assigned in the initialization, for non
                 FEC support state or type not yet known. unsupported(3)
                 value is assigned when the sublayer is not supported.
                 supported(2) value is assigned when the sublayer is
                 supported.
                 This object is applicable for an OLT, with the same
                 value for all virtual interfaces, and for an ONU.
                 The FEC counters will have a zero value when the
                 interface is not supporting FEC.
                 The counters:
                  dot3EponFecPCSCodingViolation - not affected by FEC
                  ability.
                  dot3EponFecCorrectedBlocks    - has a zero value when
                   dot3EponFecAbility is unknown(1) and unsupported(3).
                  dot3EponFecUncorrectableBlocks  - has a zero value when
                   dot3EponFecAbility is unknown(1) and unsupported(3).
                  dot3EponFecBufferHeadCodingViolation - has a zero value
                   when dot3EponFecAbility is unknown(1) and
                   unsupported(3)."
        REFERENCE   "IEEE Std 802.3, 30.5.1.1.13."
        ::= { dot3EponFecEntry 2}

dot3EponFecMode OBJECT-TYPE
        SYNTAX  INTEGER {
                unknown(1),
                disabled(2),
                enabled(3)
        }
        MAX-ACCESS  read-write
        STATUS  current
        DESCRIPTION
                "An object that defines the mode of operation of the
                 optional FEC sublayer of the 1000BASE-PX PHY, specified
                 in IEEE Std 802.3, 65.2, and reflects its state.
```

```
                A GET operation returns the current mode of operation
                of the PHY. A SET operation changes the mode of
                operation of the PHY to the indicated value.
                unknown(1) value is assigned in the initialization for non
                  FEC support state or type not yet known.
                disabled(2) value is assigned when the FEC sublayer is
                  operating in disabled mode.
                enabled(3) value is assigned when the FEC sublayer is
                  operating in FEC mode.
                The write operation is not restricted in this document
                and can be done at any time. Changing dot3EponFecMode
                state can lead to disabling the Forward Error Correction
                on the respective interface, which can lead to a
                degradation of the optical link, and therefore may lead
                to an interruption of service for the users connected to
                the respective EPON interface.
                This object is applicable for an OLT and an ONU. At the
                OLT, it has a distinct value for each virtual interface.
                The counting of
                the FEC counters will stop when the FEC of the interface
                is disabled.
                The counters:
                 dot3EponFecPCSCodingViolation - not affected by FEC
                 mode.
                 dot3EponFecCorrectedBlocks - stops counting when
                 Rx_FEC is not enabled. (unknown(1) and disabled(2)).
                 dot3EponFecUncorrectableBlocks - stops counting when
                 Rx_FEC is not enabled (unknown(1) and disabled(2)).
                 dot3EponFecBufferHeadCodingViolation - stops counting
                 when Rx_FEC is not enabled (unknown(1) and
                 disabled(2)).
                The object:
                 dot3EponFecAbility - indicates the FEC ability and
                 is not affected by the dot3EponFecMode object."

                reset(2)
        }
        MAX-ACCESS   read-write
        STATUS   current
        DESCRIPTION
                "This object is used to reset the EPON interface. The
                 interface may be unavailable while the reset occurs and
                 data may be lost.
                 Setting this object to running(1) will cause the
                 interface to enter into running mode. Setting this
                 object to reset(2) will cause the interface to go into
                 reset mode. When getting running(1), the interface is in
                 running mode. When getting reset(2), the interface is in
                 reset mode.
                 The write operation is not restricted in this document
                 and can be done at any time. Changing
                 dot3ExtPkgObjectReset state can lead to a reset of the
                 respective interface, leading to an interruption of
                 service for the users connected to the respective EPON
                 interface.
```

                    This object is applicable for an OLT and an ONU. At the
                    OLT, it has a distinct value for each virtual interface.
                    A reset for a specific virtual interface resets only
                    this virtual interface and not the physical interface.
                    Thus, a virtual link that is malfunctioning can be
                    reset without affecting the operation of other virtual
                    interfaces.
                    The reset can cause Discontinuities in the values of the
                    counters of the interface, similar to re-initialization
                    of the management system. Discontinuity should be
                    indicated by the ifCounterDiscontinuityTime object of
                    the Interfaces Group MIB module."
         DEFVAL { running }
         ::= { dot3ExtPkgControlEntry 1 }

dot3ExtPkgObjectPowerDown OBJECT-TYPE
         SYNTAX   TruthValue
         MAX-ACCESS   read-write
         STATUS   current
         DESCRIPTION
                    "This object is used to power down the EPON interface.
                     The interface may be unavailable while the power down
                     occurs and data may be lost.
                     Setting this object to true(1) will cause the interface
                     to enter into power down mode. Setting this object to
                     false(2) will cause the interface to go out of power
                     down mode. When getting true(1), the interface is in
                     power down mode. When getting false(2), the interface is
                     not in power down mode.
                     The write operation is not restricted in this document
                     and can be done at any time. Changing
                     dot3ExtPkgObjectPowerDown state can lead to a power down
                     of the respective interface, leading to an interruption
                     of service of the users connected to the respective EPON
                     interface.
                     This object is applicable for an OLT and an ONU. At the
                     OLT, it has a distinct value for each virtual interface.
                     A power down/up of a specific virtual interface affects
                     only the virtual interface and not the physical
                     interface. Hence a virtual link, which needs a certain
                     handling, can be powered down and then powered up without
                     disrupting the operation of other virtual interfaces.
                     The object is relevant when the admin state of the
                     interface is active as set by the dot3MpcpAdminState."

             fecTxEnabled(2),
             fecRxEnabled(3),
             fecTxRxEnabled(4)
     }
     MAX-ACCESS  read-write
     STATUS  current
     DESCRIPTION
             "An object defining the FEC mode of operation of the
              interface, and indicating its state. The modes defined in
              this object are extensions to the FEC modes defined in
              the dot3EponFecMode object.
              When noFECEnabled(1), the interface does not enable FEC
              mode.
              When fecTxEnabled(2), the interface enables the FEC
              transmit mode.
              When fecRxEnabled(3), the interface enables the FEC
              receive mode.
              When fecTxRxEnabled(4), the interface enables the FEC
              transmit and receive mode.
              This object is applicable for an OLT and an ONU. At the
              OLT, it has a distinct value for each virtual interface.
              The FEC counters are referring to the receive path. The
              FEC counters will stop when the FEC receive mode of the
              interface is disabled, as defined by fecRxEnabled(3)
              and fecTxRxEnabled(4) values.
              The counters:
               dot3EponFecPCSCodingViolation - not affected by FEC
               mode.
               dot3EponFecCorrectedBlocks - stops counting when
               Rx_FEC is not enabled (noFecEnabled(1) and
               fecTxEnabled(2)).
               dot3EponFecUncorrectableBlocks - stops counting when
               Rx_FEC is not enabled (noFecEnabled(1) and
               fecTxEnabled(2)).
               dot3EponFecBufferHeadCodingViolation - stops counting
               when Rx_FEC is not enabled (noFecEnabled(1) and
               fecTxEnabled(2)).
              The objects:
               dot3EponFecAbility - indicates the FEC ability and is
               not affected by the FEC mode.
               dot3EponFecMode - indicates the FEC mode for combined RX
               and TX.
              The write operation is not restricted in this document
              and can be done at any time. Changing
              dot3ExtPkgObjectFecEnabled state can lead to disabling
              the Forward Error Correction on the respective interface,
              which can lead to a degradation of the optical link, and
              therefore may lead to an interruption of service for the
              users connected to the respective EPON interface."

dot3ExtPkgObjectRegisterAction OBJECT-TYPE
    SYNTAX  INTEGER {
            none(1),
            register(2),
            deregister(3),
            reregister(4)
    }
    MAX-ACCESS  read-write
    STATUS  current
    DESCRIPTION
            "An object configuring the registration state of an
            interface, and indicating its registration state.
             Write operation changes the registration state to its new
             value.
             Read operation returns the value of the state.
             The registration state is reflected in this object and in
             the dot3MpcpRegistrationState object.
             none(1) indicates an unknown state,
             register(2) indicates a registered LLID,
             deregister(3) indicates a deregistered LLID,
             reregister(4) indicates an LLID that is reregistering.
             The following list describes the operation of the
             interface, as specified in the IEEE Std 802.3, when a write
             operation is setting a value.
              none(1) - not doing any action.
              register(2) - registering an LLID that has been requested
              for registration (The LLID is in registering mode.
                 dot3MpcpRegistrationState - registering(2) ).
                 deregister(3) - deregisters an LLID that is registered
                    (dot3MpcpRegistrationState - registered(3) ).
                 reregister(4) - reregister an LLID that is registered
                    (dot3MpcpRegistrationState - registered(3) ).
                 The behavior of an ONU and OLT interfaces, at each one
                  of the detailed operation at each state, is described in
                  the registration state machine of figure 64-22,
                  IEEE Std 802.3.
                 This object is applicable for an OLT and an ONU. At the
                 OLT, it has a distinct value for each virtual interface.
                 The write operation is not restricted in this document
                 and can be done at any time. Changing
                 dot3ExtPkgObjectRegisterAction state can lead to a change
                 in the registration state of the respective interface
                 leading to a deregistration and an interruption of
```

```
                        service of the users connected to the respective EPON
                        interface."
                DEFVAL { none }
                ::= { dot3ExtPkgControlEntry 6 }

  dot3ExtPkgQueueTable OBJECT-TYPE
        SYNTAX  SEQUENCE OF Dot3ExtPkgQueueEntry
        MAX-ACCESS  not-accessible
        STATUS  current
        DESCRIPTION
                "A table of the extended package objects for queue
                 management. The IEEE Std 802.3 MPCP defines a report message
                 of the occupancy of the transmit queues for the feedback
                 BW request from the ONUs. These queues serve the uplink
                 transmission of the ONU and data is gathered there until
                 the ONU is granted for transmission.
                 The management table of the queues is added here mainly
                 to control the reporting and to gather some statistics
                 of their operation. This table is not duplicating
                 existing management objects of bridging queues,
                 specified in IEEE Std 802.1D, since the existence of a
                 dedicated transmit queuing mechanism is implied in the
                 IEEE Std 802.3, and the ONU may be a device that is not a
                 bridge with embedded bridging queues.
                 The format of the REPORT message, as specified
                 in IEEE Std 802.3, is presented below:
                 +----------------------------------+
                 |         Destination Address      |
                 +----------------------------------+
                 |           Source Address         |
                 +----------------------------------+
                 |            Length/Type           |
                 +----------------------------------+

                 +----------------------------------+
```

```
              |              FCS                    |
              +-----------------------------------+

              The 'Queue report' field reports the occupancy of each
              uplink transmission queue.
              The number of queue sets defines the number of the
              reported sets, as would be explained in the description
              of the dot3ExtPkgQueueSetsTable table. For each set the
              report bitmap defines which queue is present in the
              report, meaning that although the MPCP REPORT message
              can report up to 8 queues in a REPORT message, the
              actual number is flexible. The Queue table has a
              variable size that is limited by the
              dot3ExtPkgObjectReportMaximumNumQueues object, as an
              ONU can have fewer queues to report.
              The entries in the table are control and status
              indication objects for managing the queues of an EPON
              interface that are gathered in an extended package as
              an addition to the objects that are based on the
              IEEE Std 802.3 attributes.
              Each object has a row for every virtual link and for
              every queue in the report.
              The LLID field, as defined in the IEEE Std 802.3, is a 2-byte
              register (15-bit field and a broadcast bit) limiting the
              number of virtual links to 32768. Typically the number
              of expected virtual links in a PON is like the number of
              ONUs, which is 32-64, plus an additional entry for
              broadcast LLID.
              The number of queues is between 0 and 7 and limited by
              dot3ExtPkgObjectReportMaximumNumQueues."

  dot3ExtPkgQueueEntry OBJECT-TYPE
      SYNTAX  Dot3ExtPkgQueueEntry
      MAX-ACCESS  not-accessible
      STATUS  current
      DESCRIPTION
              "An entry in the Extended package Queue table. At the
               OLT, the rows exist for each ifIndex and dot3QueueIndex.
               At the ONU, rows exist for the single ifIndex for each
               dot3QueueIndex.
               Rows in the table are created when the ifIndex of the
               link is created. A set of rows per queue are added for
               each ifIndex, denoted by the dot3QueueIndex.
               A set of rows per queue in the table, for an ONU
               interface, are created at the system initialization.
               A set of rows per queue in the table, corresponding to
               the OLT ifIndex and a set of rows per queue
               corresponding to the broadcast virtual link, are
               created at the system initialization.
               A set of rows per queue in the table, corresponding to
               the ifIndex of a virtual link, are created when the
               virtual link is established (ONU registers), and deleted
               when the virtual link is deleted (ONU deregisters)."

        DESCRIPTION
                "An object that defines the number of thresholds for each
                 queue in the REPORT message as defined in IEEE Std 802.3,
                 Clause 64.
                 Each queue_set reporting will provide information on the
                 queue occupancy of frames below the matching Threshold.
                 Read operation reflects the number of thresholds.
                 Write operation sets the number of thresholds for each
                 queue.
                 The write operation is not restricted in this document
                 and can be done at any time. Value cannot exceed the
                 maximal value defined by the
                 dot3ExtPkgObjectReportMaximumNumThreshold object.
                 Changing dot3ExtPkgObjectReportNumThreshold can lead to
                 a change in the reporting of the ONU interface and
                 therefore to a change in the bandwidth allocation of the
                 respective interface. This change may lead a degradation
                 or an interruption of service of the users connected to
                 the respective EPON interface.
                 This object is applicable for an OLT and an ONU. At the
                 OLT, it has a distinct value for each virtual interface
                 and for each queue. At the ONU, it has a distinct value
                 for each queue."

    dot3ExtPkgQueueSetsTable OBJECT-TYPE
        SYNTAX  SEQUENCE OF Dot3ExtPkgQueueSetsEntry
        MAX-ACCESS  not-accessible
        STATUS  current
        DESCRIPTION
                "A table of Extended package objects used for the
                 management of the queue_sets. Entries are control and
                 status indication objects of an EPON interface, which
                 are gathered in an extended package as an addition to
                 the objects based on the IEEE Std 802.3 attributes. The
                 objects in this table are specific for the queue_sets,
                 which are reported in the MPCP REPORT message as defined
                 in IEEE Std 802.3, Clause 64.
                 The IEEE Std 802.3 MPCP defines a report message of the
                 occupancy of the transmit queues for the feedback BW
                 request from the ONUs. These queues serve the uplink
                 transmission of the ONU and data is gathered there until
                 the ONU is granted for transmission.
                 The management table of the queues_sets is added here
                 mainly to control the reporting and to gather some
                 statistics of their operation. This table is not
                 duplicating existing management objects of bridging
                 queues, specified in IEEE Std 802.1D, since the existence of a
                 dedicated transmit queuing mechanism is implied in the
                 IEEE Std 802.3, and the ONU may be a device that is not a
                 bridge with embedded bridging queues.
                 The format of the REPORT message, as specified
                 in IEEE Std 802.3, is presented below:
                 +--------------------------------+
                 |       Destination Address      |
                 +--------------------------------+
                 |         Source Address         |
                 +--------------------------------+
                 |          Length/Type           |
                 +--------------------------------+
                 |            OpCode              |
                 +--------------------------------+
                 |          TimeStamp             |
```

```
+----------------------------------+
|          Number of queue Sets    |

+----------------------------------+
```

As can be seen from the message format, the ONU
interface reports of the status of up to 8 queues
and it can report in a single MPCP REPORT message
of a few sets of queues.
The number of queue_sets defines the number of the
reported sets, and it can reach a value of up to 8.
It means that an ONU can hold a variable number of
sets between 0 and 7.
The dot3ExtPkgQueueSetsTable table has a variable
queue_set size that is limited by the
dot3ExtPkgObjectReportMaximumNumThreshold object as an
ONU can have fewer queue_sets to report.
The 'Queue report' field reports the occupancy of each
uplink transmission queue. The queue_sets can be used to
report the occupancy of the queues in a few levels as to
allow granting, in an accurate manner, of only part of
the data available in the queues. A Threshold is
defined for each queue_set to define the level of the
queue that is counted for the report of the occupancy.
The threshold is reflected in the queue_set table by the
dot3ExtPkgObjectReportThreshold object.
For each queue set, the report bitmap defines which
queues are present in the report, meaning that
although the MPCP REPORT message can report of up to 8
queues in a REPORT message, the actual number is
flexible.
The dot3ExtPkgQueueSetsTable table has a variable queue
size that is limited by the
dot3ExtPkgObjectReportMaximumNumQueues object as an ONU
can have fewer queues to report.
Each object has a row for every virtual link, for each
queue in the report and for each queue_set in the queue.
The LLID field, as defined in the IEEE Std 802.3, is a 2-byte

```
                    register (15-bit field and a broadcast bit) limiting the
                    number of virtual links to 32768. Typically the number
                    of expected virtual links in a PON is like the number of
                    ONUs, which is 32-64, plus an additional entry for
                    broadcast LLID.
                    The number of queues is between 0 and 7 and limited by
                    dot3ExtPkgObjectReportMaximumNumQueues.
                    The number of queues_sets is between 0 and 7 and limited
                    by dot3ExtPkgObjectReportMaximumNumThreshold."
        ::= { dot3ExtPkgControlObjects 3 }

    dot3ExtPkgQueueSetsEntry OBJECT-TYPE
        SYNTAX  Dot3ExtPkgQueueSetsEntry
        MAX-ACCESS  not-accessible
        STATUS  current
        DESCRIPTION
                "An entry in the Extended package queue_set table. At
                 the OLT, the rows exist for each ifIndex,
                 dot3QueueSetQueueIndex and dot3QueueSetIndex. At the
                 ONU, rows exist for the single ifIndex, for each
                 dot3QueueSetQueueIndex and dot3QueueSetIndex.
                 Rows in the table are created when the ifIndex of the
                 link is created. A set of rows per queue and per
                 queue_set are added for each ifIndex, denoted by
                 dot3QueueSetIndex and dot3QueueSetQueueIndex.
                 A set of rows per queue and per queue_set in the table,
                 for an ONU interface are created at system
                 initialization.
                 A set of rows per queue and per queue_Set in the table,
                 corresponding to the OLT ifIndex and a set of rows per
                 queue and per queue_set, corresponding to the broadcast
                 virtual link, are created at system initialization.
                 A set of rows per queue and per queue_set in the table,
                 corresponding to the ifIndex of a virtual link are
                 created when the virtual link is established (ONU
                 registers) and deleted when the virtual link is deleted
                 (ONU deregisters)."

                   in the MPCP REPORT message as defined in IEEE Std 802.3,
                   Clause 64.
                   The number of queues_sets is between 0 and 7, and
                   limited by dot3ExtPkgObjectReportMaximumNumThreshold."
          ::= { dot3ExtPkgQueueSetsEntry 2 }

          dot3ExtPkgObjectReportThreshold OBJECT-TYPE
          SYNTAX  Unsigned32
          UNITS        "TQ (16 ns)"
          MAX-ACCESS  read-write
          STATUS  current
          DESCRIPTION
                  "An object that defines the value of a threshold report
                   for each queue_set in the REPORT message as defined in
                   IEEE Std 802.3, Clause 64. The number of sets for each queue
                   is dot3ExtPkgObjectReportNumThreshold.
                   In the REPORT message, each queue_set reporting will
                   provide information on the occupancy of the queues for
                   frames below the matching Threshold.
                   The value returned shall be in Time quanta (TQ), which
                   is 16 ns or 2 octets increments.
                   Read operation provides the threshold value. Write
                   operation sets the value of the threshold.
                   The write operation is not restricted in this document
                   and can be done at any time. Changing
                   dot3ExtPkgObjectReportThreshold can lead to a change in
                   the reporting of the ONU interface and therefore to a
                   change in the bandwidth allocation of the respective
                   interface. This change may lead a degradation or an
                   interruption of service for the users connected to the
                   respective EPON interface.
                   This object is applicable for an OLT and an ONU. At the
                   OLT, it has a distinct value for each virtual interface,
                   for each queue and for each queue_set. At the ONU, it has
                   a distinct value for each queue and for each queue_set."

          ::= { dot3ExtPkgQueueSetsEntry 3 }

  --Optical Interface status tables

  dot3ExtPkgOptIfTable OBJECT-TYPE
      SYNTAX      SEQUENCE OF Dot3ExtPkgOptIfEntry
      MAX-ACCESS not-accessible
      STATUS      current
      DESCRIPTION
              "This table defines the control and status indication
               objects for the optical interface of the EPON interface.
               Each object has a row for every virtual link denoted by
```

```
                    the corresponding ifIndex.
                    The LLID field, as defined in the IEEE Std 802.3, is a 2-byte
                    register (15-bit field and a broadcast bit) limiting the
                    number of virtual links to 32768. Typically the number
                    of expected virtual links in a PON is like the number of
                    ONUs, which is 32-64, plus an additional entry for
                    broadcast LLID.
                    Although the optical interface is a physical interface,
                    there is a row in the table for each virtual interface.
                    The reason for having a separate row for each virtual
                    link is that the OLT has a separate link for each one of
                    the ONUs. For instance, ONUs could be in different
                    distances with different link budgets and different
                    receive powers, therefore having different power alarms.
                    It is quite similar to a case of different physical
                    interfaces."

  dot3ExtPkgOptIfTransmitEnable OBJECT-TYPE
     SYNTAX  TruthValue
     MAX-ACCESS  read-write
     STATUS  current
     DESCRIPTION
              "Setting this object to true(1) will cause the optical
               interface to start transmission (according to the
               control protocol specified for the logical interface).
               Setting this object to false(2) will cause the
               interface to stop the optical transmission.
               When getting true(1), the optical interface is in
               transmitting mode (obeying to the logical control
               protocol).
               When getting false(2), the optical interface is not in
               transmitting mode.
               The write operation is not restricted in this document
               and can be done at any time. Changing
               dot3ExtPkgOptIfTransmitEnable state can lead to a halt
               in the optical transmission of the respective interface
               leading to an interruption of service of the users
               connected to the respective EPON interface.
               The object is relevant when the admin state of the
               interface is active as set by the dot3MpcpAdminState.
               This object is applicable for an OLT and an ONU. At the
               OLT it, has a distinct value for each virtual interface."

10. Ethernet-like interface MIB module

10.1 Introduction

This clause defines a portion of the Management Information Base (MIB) for use with SNMP. In particular, it defines objects for managing Ethernet-like interfaces.

10.2 Overview

Instances of these object types represent attributes of an interface to an Ethernet-like communications medium.

The definitions presented here are based on Clause 30 of IEEE Std 802.3. Implementors of these MIB objects should note that IEEE Std 802.3 explicitly describes (in the form of Pascal pseudocode) when, where, and how various MAC attributes are measured. IEEE Std 802.3 also describes the effects of MAC actions that may be invoked by manipulating instances of the MIB objects defined here.

To the extent that some of the attributes defined in IEEE Std 802.3 are represented by previously defined objects in MIB-2 from IETF RFC 1213 or in the Interfaces Group MIB defined in IETF RFC 2863, such attributes are not redundantly represented by objects defined in this clause. Among the attributes represented by objects defined in other MIB module specifications are the number of octets transmitted or received on a particular interface, the number of frames transmitted or received on a particular interface, the promiscuous status of an interface, the MAC address of an interface, and multicast information associated with an interface.

10.2.1 Relation to MIB-2

This subclause applies only when this MIB is used in conjunction with the IETF RFC 1213 interface group.

The relationship between an Ethernet-like interface and an interface in the context of MIB-2 is one-to-one. As such, the value of an ifIndex object instance can be directly used to identify corresponding instances of the objects defined herein.

10.2.2 Relation to the Interfaces Group MIB

The Interfaces Group MIB defined in IETF RFC 2863 requires that any MIB that is an adjunct of the Interfaces Group MIB clarify specific areas within the Interfaces Group MIB. These areas were intentionally left vague in the Interfaces Group MIB to avoid over constraining the MIB, thereby precluding management of certain media-types.

Section 4 of IETF RFC 2863 enumerates several areas which a media-specific MIB must (wherein the word "must" is used in accordance with the requirements of IETF RFC 2119) clarify. Each of these areas is addressed in a following subclause. The implementor is referred to IETF RFC 2863 in order to understand the general intent of these areas.

10.2.2.1 ifRcvAddressTable

This table contains all IEEE 802.3 addresses, unicast, multicast, and broadcast, for which this interface will receive packets and forward them up to a higher layer entity for local consumption. The format of the address, contained in ifRcvAddressAddress, is the same as for ifPhysAddress.

In the event that the interface is part of a MAC bridge, this table does not include unicast addresses that are accepted for possible forwarding out some other port. This table is explicitly not intended to provide a bridge address filtering mechanism.

10.2.2.2 ifType

All Ethernet-like interfaces shall return ethernetCsmacd(6) for ifType. Information on the particular port type and operating speed is available from ifSpeed in the Interfaces Group MIB, and ifMauType in the MAU-MIB module defined in Clause 13. All Ethernet-like interfaces shall also implement the MAU-MIB module defined in Clause 13.[16]

10.2.2.3 ifXxxOctets

The Interfaces Group MIB octet counters, ifInOctets, ifOutOctets, ifHCInOctets, and ifHCOutOctets include all octets in valid frames sent or received on the interface, including the MAC header and FCS, but not the preamble, start of frame delimiter, or extension octets. This corresponds to the definition of frameSize/8 in 4.2.7.1 of IEEE Std 802.3 (frameSize is defined in bits rather than octets, and is defined as $2 \times$ addressSize + lengthOrTypeSize + dataSize + crcSize). They do not include the number of octets in collided or failed transmit attempts, since the MAC layer driver typically does not have visibility to count these octets. They also do not include octets in received invalid frames, since this information is normally not passed to the MAC layer, and since non-promiscuous MAC implementations cannot reliably determine whether an invalid frame was actually addressed to this station.

Note that these counters do include octets in valid MAC control frames sent or received on the interface, as well as octets in otherwise valid received MAC frames that are discarded by the MAC layer for some reason (insufficient buffer space, unknown protocol, etc.).

Note that the octet counters in IF-MIB do not exactly match the definition of the octet counters in IEEE Std 802.3. aOctetsTransmittedOK and aOctetsReceivedOK count only the octets in the clientData and Pad fields, whereas ifInOctets and ifOutOctets include the entire MAC frame, including MAC header and FCS. However, the IF-MIB counters can be derived from the IEEE 802.3 counters as follows in Equation (1) and Equation (2):

$$\text{ifInOctets} \ = \ \text{aOctetsReceivedOK} + (18 \times \text{aFramesReceivedOK}) \tag{1}$$

$$\text{ifOutOctets} \ = \ \text{aOctetsTransmittedOK} + (18 \times \text{aFramesTransmittedOK}) \tag{2}$$

Another difference to keep in mind between the IF-MIB counters and IEEE 802.3 counters is that, in IEEE Std 802.3, the frame counters and octet counters are always incremented together. aOctetsTransmittedOK counts the number of octets in frames that were counted by aFramesTransmittedOK. aOctetsReceivedOK counts the number of octets in frames that were counted by aFramesReceivedOK. This is not the case with the IF-MIB counters. The IF-MIB octet counters count the number of octets sent to or received from the layer below this interface, whereas the packet counters count the number of packets sent to or received from the layer above. Therefore, received MAC Control frames, ifInDiscards, and ifInUnknownProtos are counted by ifInOctets, but not ifInXcastPkts. Transmitted MAC Control frames are counted by ifOutOctets, but not ifOutXcastPkts. ifOutDiscards and ifOutErrors are counted by ifOutXcastPkts, but not ifOutOctets.

10.2.2.4 ifXxxXcastPkts

The packet counters in the IF-MIB do not exactly match the definition of the frame counters in IEEE Std 802.3. aFramesTransmittedOK counts the number of frames successfully transmitted on the interface,

---

[16]There are three other interface types defined in IANAifType-MIB for Ethernet, namely fastEther(62), fastEtherFX(69), and giga-bitEthernet(117). Management applications should be prepared to receive these obsolete ifType values from older implementations.

whereas ifOutUcastPkts, ifOutMulticastPkts, and ifOutBroadcastPkts count the number of transmit requests made from a higher layer, whether or not the transmit attempt was successful. This means that packets counted by ifOutErrors or ifOutDiscards are also counted by ifOutXcastPkts, but are not counted by aFramesTransmittedOK. This also means that, since MAC Control frames are generated by a sublayer internal to the interface layer rather than by a higher layer, they are not counted by ifOutXcastPkts, but are counted by aFramesTransmittedOK.

$$\text{aFramesTransmittedOK} = \text{ifOutUcastPkts} + \text{ifOutMulticastPkts} \qquad (3)$$
$$+ \text{ifOutBroadcastPkts} + \text{dot3OutPauseFrames}$$
$$- (\text{ifOutErrors} + \text{ifOutDiscards})$$

Similarly, aFramesReceivedOK counts the number of frames received successfully by the interface, whether or not they are passed to a higher layer, whereas ifInUcastPkts, ifInMulticastPkts, and ifInBroadcastPkts count only the number of packets passed to a higher layer. This means that packets counted by ifInDiscards or ifInUnknownProtos are also counted by aFramesReceivedOK, but are not counted by ifInXcastPkts. This also means that, since MAC Control frames are consumed by a sublayer internal to the interface layer and not passed to a higher layer, they are not counted by ifInXcastPkts, but are counted by aFramesReceivedOK.

$$\text{aFramesReceivedOK} = \text{ifInUcastPkts} + \text{ifInMulticastPkts} \qquad (4)$$
$$+ \text{ifInBroadcastPkts} + \text{dot3InPauseFrames}$$
$$+ \text{ifInDiscards} + \text{ifInUnknownProtos}$$

This specification chooses to treat MAC control frames as being originated and consumed within the interface and not counted by the IF-MIB packet counters. MAC control frames are normally sent as multicast packets. In many network environments, MAC control frames can greatly outnumber multicast frames carrying actual data. If MAC control frames were included in the ifInMulticastPkts and ifOutMulticastPkts, the count of data-carrying multicast packets would tend to be drowned out by the count of MAC control frames, rendering those counters considerably less useful.

To better understand the issues surrounding the mapping of the IF-MIB packet and octet counters to an Ethernet interface, it is useful to refer to a Case diagram (Case and Partridge [B1]) for the IF-MIB counters, with modifications to show the proper interpretation for the Ethernet interface. This is depicted in Figure 10–1.

sublayer above
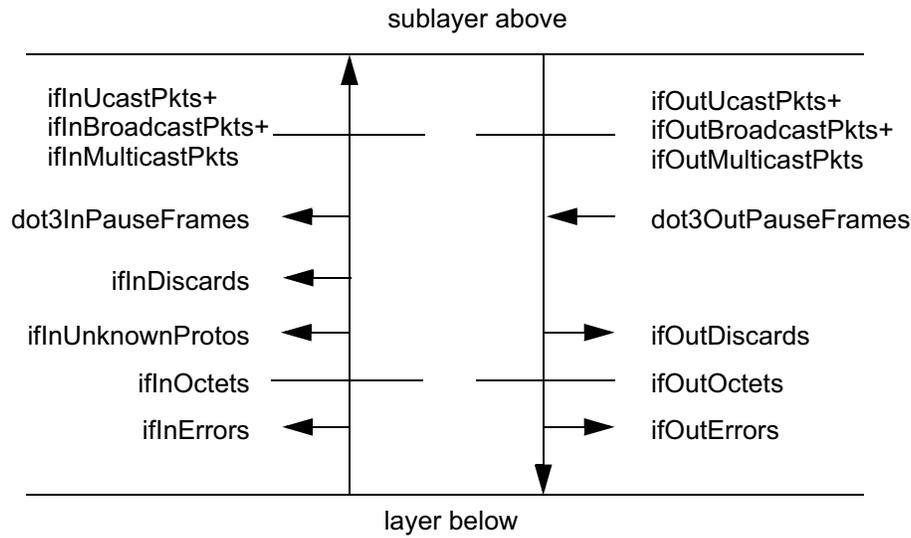

Figure 10–1—Case diagram for the IF-MIB counters

10.2.2.5 ifMtu

The defined standard MTU for Ethernet-like interfaces is 1500 octets. However, many implementations today support larger packet sizes than IEEE Std 802.3. The value of this object shall reflect the actual MTU in use on the interface, whether it matches the standard MTU or not.

This value should reflect the value seen by the MAC client interface. When a higher layer protocol, like IP, is running over Ethernet framing, this is the MTU that will be seen by that higher layer protocol. However, most Ethernet-like interfaces today run multiple protocols that use a mix of different framing types. For example, an IEEE 802.2 LLC type 1 client protocol will see an MTU of 1497 octets on an interface using the IEEE standard maximum packet size, and a protocol running over SNAP will see an MTU of 1492 octets on an interface using the IEEE standard maximum packet size. However, since specification mandates using the MTU as seen at the MAC client interface, the value of ifMtu would be reported as 1500 octets in these cases.

10.2.2.6 ifSpeed and ifHighSpeed

For Ethernet-like interfaces operating at 1000 Megabits per second (Mb/s) or less, ifSpeed will represent the current operational speed of the interface in bits per second. For such interface types, this will be equal to 1 000 000 (1 million), 10 000 000 (10 million), 100 000 000 (100 million), or 1 000 000 000 (1 billion). ifHighSpeed will represent the current operational speed in millions of bits per second. For such Ethernet-like interfaces, this will be equal to 1, 10, 100, or 1000. If the interface implements Auto-Negotiation, Auto-Negotiation is enabled for this interface, and the interface has not yet negotiated to an operational speed, these objects should reflect the maximum speed supported by the interface.

For Ethernet-like interfaces operating at greater than 1000 Mb/s, ifHighSpeed will represent the current operational speed of the interface in millions of bits per second. Note that for WAN implementations, this will be the payload data rate over the WAN interface sublayer. For current implementations, this will be equal to 10 000 for LAN implementations of 10 Gb/s, and 9294 for WAN implementations of the 10 Gb/s MAC over an OC-192 PHY. For these speeds, ifSpeed should report a maximum unsigned 32-bit value of 4 294 967 295 as specified in IETF RFC 2863.

These objects shall indicate the correct line speed regardless of the current duplex mode. They shall not indicate a doubled value when operating in full-duplex mode. The duplex mode of the interface may be determined by examining either the dot3StatsDuplexStatus object in this MIB module, or the ifMauType MAU-MIB module object defined in Clause 13.

10.2.2.7 ifPhysAddress

This object contains the IEEE 802.3 address that is placed in the source-address field of any Ethernet, Starlan, or IEEE 802.3 frames that originate at this interface. Usually this will be kept in ROM on the interface hardware. Some systems may set this address via software.

In a system where there are several such addresses the designer has a tougher choice. The address chosen should be the one most likely to be of use to network management (e.g., the address placed in ARP responses for systems that are primarily IP systems).

If the designer truly cannot choose, use of the factory-provided ROM address is suggested.

If the address cannot be determined, an octet string of zero length should be returned.

The address is stored in binary in this object. The address is stored in "canonical" bit order, that is, the Group Bit is positioned as the low-order bit of the first octet. Thus, the first byte of a multicast address would have the bit 0x01 set.

10.2.2.8 Specific Interfaces Group MIB objects

Table 10–1 provides specific implementation guidelines for applying the Interfaces Group objects to Ethernet-like interfaces.

Table 10–1—Implementation guidelines

Object	Guidelines
ifIndex	Each Ethernet-like interface is represented by an ifEntry. The dot3StatsTable in this MIB module is indexed by dot3StatsIndex. The interface identified by a particular value of dot3StatsIndex is the same interface as identified by the same value of ifIndex.
ifDescr	Refer to IETF RFC 2863.
ifType	Refer to 10.2.2.2.
ifMtu	Refer to 10.2.2.5.
ifSpeed	Refer to 10.2.2.6.
ifPhysAddress	Refer to 10.2.2.7.
ifAdminStatus	Write access is not required. Support for 'testing' is not required.
ifOperStatus	The operational state of the interface. Support for 'testing' is not required. The value 'dormant' has no meaning for an Ethernet-like interface.
ifLastChange	Refer to IETF RFC 2863.

Table 10–1—Implementation guidelines *(continued)*

Object	Guidelines
ifInOctets	The number of octets in valid MAC frames received on this interface, including the MAC header and FCS. This does include the number of octets in valid MAC Control frames received on this interface. See 10.2.2.3.
ifInUcastPkts	Refer to IETF RFC 2863. Note that this does not include MAC Control frames, since MAC Control frames are consumed by the interface layer and are not passed to any higher layer protocol. See 10.2.2.4.
ifInDiscards	Refer to IETF RFC 2863.
ifInErrors	The sum for this interface of dot3StatsAlignmentErrors, dot3StatsFCSErrors, dot3StatsFrameTooLongs, and dot3StatsInternalMacReceiveErrors.
ifInUnknownProtos	Refer to IETF RFC 2863.
ifOutOctets	The number of octets transmitted in valid MAC frames on this interface, including the MAC header and FCS. This does include the number of octets in valid MAC Control frames transmitted on this interface. See 10.2.2.3.
ifOutUcastPkts	Refer to IETF RFC 2863. Note that this does not include MAC Control frames, since MAC Control frames are generated by the interface layer, and are not passed from any higher layer protocol. See 10.2.2.4.
ifOutDiscards	Refer to IETF RFC 2863.
ifOutErrors	The sum for this interface of: dot3StatsSQETestErrors, dot3StatsLateCollisions, dot3StatsExcessiveCollisions, dot3StatsInternalMacTransmitErrors and dot3StatsCarrierSenseErrors.
ifName	Locally-significant textual name for the interface (e.g., lan0).
ifInMulticastPkts	Refer to IETF RFC 2863. Note that this does not include MAC Control frames, since MAC Control frames are consumed by the interface layer and are not passed to any higher layer protocol. See 10.2.2.4.
ifInBroadcastPkts	Refer to IETF RFC 2863. Note that this does not include MAC Control frames, since MAC Control frames are consumed by the interface layer, and are not passed to ny higher layer protocol. See 10.2.2.4.
ifOutMulticastPkts	Refer to IETF RFC 2863. Note that this does not include MAC Control frames, since MAC Control frames are generated by the interface layer, and are not passed from any higher layer protocol. See 10.2.2.4.
ifOutBroadcastPkts	Refer to IETF RFC 2863. Note that this does not include MAC Control frames, since MAC Control frames are generated by the interface layer, and are not passed from any higher layer protocol. See 10.2.2.4.
ifHCInOctets, ifHCOutOctets	64-bit versions of counters. Required for Ethernet-like interfaces that are capable of operating at 20 Mb/s or faster, even if the interface is currently operating at less than 20 Mb/s.

Table 10–1—Implementation guidelines *(continued)*

Object	Guidelines
ifHCInUcastPkts, ifHCInMulticastPkts, ifHCInBroadcastPkts, ifHCOutUcastPkts, ifHCOutMulticastPkts, ifHCOutBroadcastPkts	64-bit versions of packet counters. Required for Ethernet-like interfaces that are capable of operating at 640 Mb/s or faster, even if the interface is currently operating at less than 640 Mb/s.
ifLinkUpDownTrapEnable	Refer to IETF RFC 2863. Default is 'enabled'.
ifHighSpeed	Refer to 10.2.2.6.
ifPromiscuousMode	Refer to IETF RFC 2863.
ifConnectorPresent	This will normally be 'true'. It will be 'false' in the case where this interface uses the WAN Interface Sublayer. See Clause 12 for details.
ifAlias	Refer to IETF RFC 2863.
ifCounterDiscontinuityTime	Refer to IETF RFC 2863. Note that a discontinuity in the Interfaces Group MIB counters may also indicate a discontinuity in some or all of the counters in this MIB that are associated with that interface.
ifStackHigherLayer, ifStackLowerLayer, ifStackStatus	Refer to 11.2.1.1.
ifRcvAddressAddress, ifRcvAddressStatus, ifRcvAddressType	Refer to 10.2.2.1.

10.2.3 Relation to the IEEE 802.3 MAU-MIB module

Support for the mauModIfCompl3 compliance statement of the MAU-MIB module defined in Clause 13 is required for Ethernet-like interfaces. This MIB module is needed in order to allow applications to determine the current MAU type in use by the interface, and to control autonegotiation and duplex mode for the interface. Implementing this MIB module without implementing the MAU-MIB module would leave applications with no standard way to determine the media type in use, and no standard way to control the duplex mode of the interface.

10.2.4 Mapping of IEEE 802.3 managed objects

The mapping of IEEE 802.3 managed objects to SNMP objects is shown in Table 10–2.

Table 10–2—Mapping of IEEE 802.3 managed objects

IEEE 802.3 managed object		Corresponding SNMP object
oMacEntity	.aMACID	dot3StatsIndex or IF-MIB – ifIndex
	.aFramesTransmittedOK	IF-MIB – ifOutUCastPkts + ifOutMulticastPkts + ifOutBroadcastPkts[a]
	.aSingleCollisionFrames	dot3StatsSingleCollisionFrames
	.aMultipleCollisionFrames	dot3StatsMultipleCollisionFrames
	.aFramesReceivedOK	IF-MIB – ifInUcastPkts + ifInMulticastPkts + ifInBroadcastPkts[a]
	.aFrameCheckSequenceErrors	dot3StatsFCSErrors
	.aAlignmentErrors	dot3StatsAlignmentErrors
	.aOctetsTransmittedOK	IF-MIB – ifOutOctets[a]
	.aFramesWithDeferredXmissions	dot3StatsDeferredTransmissions
	.aLateCollisions	dot3StatsLateCollisions
	.aFramesAbortedDueToXSColls	dot3StatsExcessiveCollisions
	.aFramesLostDueToIntMACXmitError	dot3StatsInternalMacTransmitErrors
	.aCarrierSenseErrors	dot3StatsCarrierSenseErrors
	.aOctetsReceivedOK	IF-MIB – ifInOctets[a]
	.aFramesLostDueToIntMACRcvError	dot3StatsInternalMacReceiveErrors
	.aPromiscuousStatus	IF-MIB – ifPromiscuousMode
	.aReadMulticastAddressList	IF-MIB – ifRcvAddressTable
	.aMulticastFramesXmittedOK	IF-MIB – ifOutMulticastPkts[a]
	.aBroadcastFramesXmittedOK	IF-MIB – ifOutBroadcastPkts[a]
	.aMulticastFramesReceivedOK	IF-MIB – ifInMulticastPkts[a]
	.aBroadcastFramesReceivedOK	IF-MIB – ifInBroadcastPkts[a]
	.aFrameTooLongErrors	dot3StatsFrameTooLongs
	.aReadWriteMACAddress	IF-MIB – ifPhysAddress
	.aCollisionFrames	dot3CollFrequencies
	.aDuplexStatus	dot3StatsDuplexStatus
	.aRateControlAbility	dot3StatsRateControlAbility
	.aMaxFrameLength	dot3StatsMaxFrameLength
	.aRateControlStatus	dot3StatsRateControlStatus

Table 10–2—Mapping of IEEE 802.3 managed objects *(continued)*

IEEE 802.3 managed object		Corresponding SNMP object
oPHYEntity	.aPHYID	dot3StatsIndex or IF-MIB – ifIndex
	.aSQETestErrors	dot3StatsSQETestErrors
	.aSymbolErrorDuringCarrier	dot3StatsSymbolErrors
oMACControlEntity	.aMACControlID	dot3StatsIndex or IF-MIB – ifIndex
	.aMACControlFunctionsSupported	dot3ControlFunctionsSupported and dot3ControlFunctionsEnabled
	.aUnsupportedOpcodesReceived	dot3ControlInUnknownOpcodes
oPAUSEEntity	.aPAUSEMACCtrlFramesTransmitted	dot3OutPauseFrames
	.aPAUSEMACCtrlFramesReceived	dot3InPauseFrames

[a]Note that the octet counters in IF-MIB do not exactly match the definition of the octet counters in IEEE Std 802.3. See 10.2.2.3 for details.

Also note that the packet counters in the IF-MIB do not exactly match the definition of the frame counters in IEEE Std 802.3. See 10.2.2.4 for details.

10.3 Security considerations for Ethernet-like interface MIB module

There is one management object defined in this MIB that has a MAX-ACCESS clause of read-write. That object, dot3PauseAdminMode, may be used to change the flow control configuration on a network interface, which may result in dropped packets, or sending flow control packets on links where the link partner will not understand them. Either action could be detrimental to network performance.

Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

Most of the objects in this MIB module contain statistical information about particular network links. In some network environments, this information may be considered sensitive. It is thus important to control GET and/or NOTIFY access to these objects and possibly to encrypt the values of these objects when sending them over the network via SNMP.

10.4 MIB module definition

An ASCII text version of the MIB definition can be found at the following URL:[17]

http://www.ieee802.org/3/be/public/mib_modules/20110202/802dot3dot1C10mib.txt

            DESCRIPTION "An index value that uniquely identifies an
                        interface to an Ethernet-like medium. The
                        interface identified by a particular value of
                        this index is the same interface as identified
                        by the same value of ifIndex."
            REFERENCE   "RFC 2863, ifIndex"
            ::= { dot3StatsEntry 1 }

        dot3StatsAlignmentErrors OBJECT-TYPE
            SYNTAX      Counter32
            MAX-ACCESS  read-only
            STATUS      current
            DESCRIPTION "A count of frames received on a particular
                        interface that are not an integral number of
                        octets in length and do not pass the FCS check.

                        The count represented by an instance of this
                        object is incremented when the alignmentError
                        status is returned by the MAC service to the
                        LLC (or other MAC user). Received frames for
                        which multiple error conditions pertain are,
                        according to the conventions of IEEE 802.3
                        Layer Management, counted exclusively according

                        to the error status presented to the LLC.

                        This counter does not increment for group
                        encoding schemes greater than 4 bits per group.
```

```
                    For interfaces operating at 10 Gb/s, this
                    counter can roll over in less than 5 minutes if
                    it is incrementing at its maximum rate. Since
                    that amount of time could be less than a
                    management station's poll cycle time, in order
                    to avoid a loss of information, a management
                    station is advised to poll the
                    dot3HCStatsAlignmentErrors object for 10 Gb/s
                    or faster interfaces.

                    Discontinuities in the value of this counter can
                    occur at re-initialization of the management
                    system, and at other times as indicated by the
                    value of ifCounterDiscontinuityTime."
        REFERENCE   "IEEE Std 802.3, 30.3.1.1.7,
                    aAlignmentErrors"
        ::= { dot3StatsEntry 2 }

    dot3StatsFCSErrors OBJECT-TYPE
        SYNTAX      Counter32
        MAX-ACCESS  read-only
        STATUS      current
        DESCRIPTION "A count of frames received on a particular
                    interface that are an integral number of octets
                    in length but do not pass the FCS check. This
                    count does not include frames received with
                    frame-too-long or frame-too-short error.

                    The count represented by an instance of this
                    object is incremented when the frameCheckError
                    status is returned by the MAC service to the
                    LLC (or other MAC user). Received frames for
                    which multiple error conditions pertain are,
                    according to the conventions of IEEE 802.3
                    Layer Management, counted exclusively according
                    to the error status presented to the LLC.

                    Note:  Coding errors detected by the physical
                    layer for speeds above 10 Mb/s will cause the
                    frame to fail the FCS check.

                    For interfaces operating at 10 Gb/s, this
                    counter can roll over in less than 5 minutes if

                    it is incrementing at its maximum rate. Since
                    that amount of time could be less than a
                    management station's poll cycle time, in order
                    to avoid a loss of information, a management
                    station is advised to poll the
                    dot3HCStatsFCSErrors object for 10 Gb/s or
                    faster interfaces.

                    Discontinuities in the value of this counter can
                    occur at re-initialization of the management
                    system, and at other times as indicated by the
                    value of ifCounterDiscontinuityTime."

        DESCRIPTION "For an interface operating at 100 Mb/s, the
                    number of times there was an invalid data symbol
                    when a valid carrier was present.

                    For an interface operating in half-duplex mode
                    at 1000 Mb/s, the number of times the receiving
                    media is non-idle (a carrier event) for a period
                    of time equal to or greater than slotTime, and
                    during which there was at least one occurrence
                    of an event that causes the PHY to indicate
                    'Data reception error' or 'carrier extend error'
                    on the GMII.

                    For an interface operating in full-duplex mode
                    at 1000 Mb/s, the number of times the receiving
                    media is non-idle (a carrier event) for a period
                    of time equal to or greater than minFrameSize,
                    and during which there was at least one
                    occurrence of an event that causes the PHY to
                    indicate 'Data reception error' on the GMII.

                    For an interface operating at 10 Gb/s, the
                    number of times the receiving media is non-idle
                    (a carrier event) for a period of time equal to
                    or greater than minFrameSize, and during which
                    there was at least one occurrence of an event
                    that causes the PHY to indicate 'Receive Error'
                    on the XGMII.

                    The count represented by an instance of this
                    object is incremented at most once per carrier
                    event, even if multiple symbol errors occur
                    during the carrier event. This count does
                    not increment if a collision is present.

                    This counter does not increment when the
                    interface is operating at 10 Mb/s.

                    For interfaces operating at 10 Gb/s, this
                    counter can roll over in less than 5 minutes if
                    it is incrementing at its maximum rate. Since
                    that amount of time could be less than a

                    management station's poll cycle time, in order
                    to avoid a loss of information, a management
                    station is advised to poll the

    DESCRIPTION "The current mode of operation of the MAC
                 entity. 'unknown' indicates that the current
                 duplex mode could not be determined.

                 Management control of the duplex mode is
                 accomplished through the MAU MIB. When
                 an interface does not support autonegotiation,
                 or when autonegotiation is not enabled, the
                 duplex mode is controlled using
                 ifMauDefaultType. When autonegotiation is
                 supported and enabled, duplex mode is controlled
                 using ifMauAutoNegAdvertisedBits. In either
                 case, the currently operating duplex mode is
                 reflected both in this object and in ifMauType.

                 Note that this object provides redundant
                 information with ifMauType. Normally, redundant
                 objects are discouraged. However, in this
                 instance, it allows a management application to
                 determine the duplex status of an interface
                 without having to know every possible value of
                 ifMauType. This was felt to be sufficiently
                 valuable to justify the redundancy."

                        enabledXmit(2),
                        enabledRcv(3),
                        enabledXmitAndRcv(4)
                    }
```

```
        MAX-ACCESS   read-write
        STATUS       current
        DESCRIPTION "This object is used to configure the default
                    administrative PAUSE mode for this interface.

                    This object represents the
                    administratively-configured PAUSE mode for this
                    interface. If Auto-Negotiation is not enabled
                    or is not implemented for the active MAU
                    attached to this interface, the value of this
                    object determines the operational PAUSE mode
                    of the interface whenever it is operating in
                    full-duplex mode. In this case, a set to this
                    object will force the interface into the
                    specified mode.

                    If Auto-Negotiation is implemented and enabled
                    for the MAU attached to this interface, the
                    PAUSE mode for this interface is determined by
                    Auto-Negotiation, and the value of this object
                    denotes the mode to which the interface will
                    automatically revert if/when Auto-Negotiation is
                    later disabled. Note that when Auto-Negotiation
                    is running, administrative control of the PAUSE
                    mode may be accomplished using the
                    ifMauAutoNegCapAdvertisedBits object in the
                    MAU-MIB module.

                    Note that the value of this object is ignored
                    when the interface is not operating in
                    full-duplex mode.

                    An attempt to set this object to
                    'enabledXmit(2)' or 'enabledRcv(3)' will fail
                    on interfaces that do not support operation
                    at greater than 100 Mb/s."

            MAX-ACCESS  not-accessible
            STATUS      current
            DESCRIPTION "A table containing 64-bit versions of error
                        counters from the dot3StatsTable. The 32-bit
```

```
                    versions of these counters may roll over quite
                    quickly on higher speed ethernet interfaces.
                    The counters that have 64-bit versions in this
                    table are the counters that apply to full-duplex
                    interfaces, since 10 Gb/s and faster
                    Ethernet-like interfaces do not support
                    half-duplex, and very few 1000 Mb/s
                    Ethernet-like interfaces support half-duplex.

                    Entries in this table are recommended for
                    interfaces capable of operating at 1000 Mb/s or
                    faster, and are required for interfaces capable
                    of operating at 10 Gb/s or faster. Lower speed
                    Ethernet-like interfaces do not need entries in
                    this table, in which case there may be fewer
                    entries in this table than in the
                    dot3StatsTable. However, implementations
                    containing interfaces with a mix of speeds may
                    choose to implement entries in this table for
                    all Ethernet-like interfaces."

        MAX-ACCESS read-only
        STATUS   current
        DESCRIPTION "For an interface operating at 100 Mb/s, the
                 number of times there was an invalid data symbol
                 when a valid carrier was present.

                 For an interface operating in half-duplex mode
                 at 1000 Mb/s, the number of times the receiving
                 media is non-idle (a carrier event) for a period
                 of time equal to or greater than slotTime, and
                 during which there was at least one occurrence
                 of an event that causes the PHY to indicate
                 'Data reception error' or 'carrier extend error'
                 on the GMII.

                 For an interface operating in full-duplex mode
                 at 1000 Mb/s, the number of times the receiving
                 media is non-idle (a carrier event) for a period
                 of time equal to or greater than minFrameSize,
                 and during which there was at least one
                 occurrence of an event that causes the PHY to
                 indicate 'Data reception error' on the GMII.

                 For an interface operating at 10 Gb/s, the
                 number of times the receiving media is non-idle
                 (a carrier event) for a period of time equal to
                 or greater than minFrameSize, and during which

```
                        there was at least one occurrence of an event
                        that causes the PHY to indicate 'Receive Error'
                        on the XGMII.

                        The count represented by an instance of this
                        object is incremented at most once per carrier
                        event, even if multiple symbol errors occur
                        during the carrier event. This count does
                        not increment if a collision is present.

                        This counter is a 64-bit version of
                        dot3StatsSymbolErrors. It should be used on
                        interfaces operating at 10 Gb/s or faster.

                        Discontinuities in the value of this counter can
                        occur at re-initialization of the management
                        system, and at other times as indicated by the
                        value of ifCounterDiscontinuityTime."

11. Ethernet in the First Mile copper (EFMCu) interfaces MIB module

11.1 Introduction

Ethernet-like interfaces have been defined in IEEE Std 802.3 known as Ethernet in the First Mile (EFM). In particular, 2BASE-TL and 10PASS-TS physical interfaces (PHYs), defined over voice-grade copper pairs, have been specified for the long and short reach, respectively. These interfaces, collectively called EFM Copper (EFMCu), are based on single-pair high-speed digital subscriber line (SHDSL, see ITU-T G.991.2) and very high-speed digital subscriber line (VDSL, see ITU-T G.993.1) technology, supporting optional physical medium entity (PME) aggregation (a.k.a. multi-pair bonding) with variable rates.

The 2BASE-TL PHY is capable of providing at least 2 Mb/s over a 2700 m long single copper pair with a mean bit error ratio (BER) of 10^{-7} (using 5 dB target noise margin).

The 10PASS-TS PHY is capable of providing at least 10 Mb/s over a 750 m long single copper pair with a mean BER of 10^{-7} (using 6 dB target noise margin). This clause defines a Management Information Base (MIB) module for use with SNMP to manage EFMCu interfaces. In addition, a MIB module is defined describing the cross-connect capability of a stacked interface.

11.2 Relation to other MIB modules

This subclause outlines the relationship of the MIB modules defined in this clause with other MIB modules described in other clauses of this standard, or the relevant RFCs. Specifically, the Interfaces Group MIB (IF-MIB), Ethernet-Like (IEEE8023-EtherLike-MIB), MAU (MAU-MIB), SHDSL (HDSL2-SHDSL-LINE-MIB), and VDSL (VDSL-LINE-EXT-MCM-MIB) modules are discussed.

11.2.1 Relation to Interfaces Group MIB module

2BASE-TL and 10PASS-TS PHYs specified in the EFM-CU-MIB module are stacked (a.k.a. aggregated or bonded) Ethernet interfaces and as such are managed using generic interface management objects defined in the IF-MIB defined in IETF RFC 2863.

The stack management (i.e., actual connection of the sublayers to the top-layer interface) is done via the ifStackTable, as defined in the IF-MIB defined in IETF RFC 2863, and its inverse ifInvStackTable, as defined in the IF-INVERTED-STACK-MIB defined in IETF RFC 2864.

The new tables ifCapStackTable and its inverse ifInvCapStackTable defined in the IF-CAP-STACK-MIB module below, extend the stack management with an ability to describe possible connections or cross-connect capability, when a flexible cross-connect matrix is present between the interface layers.

11.2.1.1 Layering model

An EFMCu interface can aggregate up to 32 physical medium entity (PME) sublayer devices (modems), using the so-called PME aggregation function (PAF).

A generic EFMCu device can have a number of physical coding sublayer (PCS) ports, each connected to a media access controller (MAC) via a media independent interface (MII) at the upper layer, and cross-connected to a number of underlying PMEs, with a single PCS per PME relationship. See 61.1 of IEEE Std 802.3 for more details.

Each PME in the aggregated EFMCu port is represented in the Interface table (ifTable) as a separate interface with ifType of shdsl(169) for 2BASE-TL or vdsl(97) for 10PASS-TS. The ifType values are defined in [IANAifType-MIB].

ifSpeed for each PME shall return the actual data bitrate of the active PME (e.g., for 2BaseTL PMEs it is a multiple of 64 kb/s). A zero value shall be returned when the PME is Initializing or Down.

The ifSpeed of the PCS is the sum of the current operating data rates of all PMEs in the aggregation group, without the 64/65-octet encapsulation overhead and PAF overhead, but accounting for the inter-frame gaps (IFGs).

When using the stated definition of ifSpeed for the PCS, there would be no frame loss in the configuration shown in Figure 11–1 (the test-sets are configured to generate 100% of back-to-back traffic, i.e., minimal IFG, at 10 Mb/s or 100 Mb/s, with min and max frame sizes; the EFM interfaces are aggregated to achieve the shown speed).
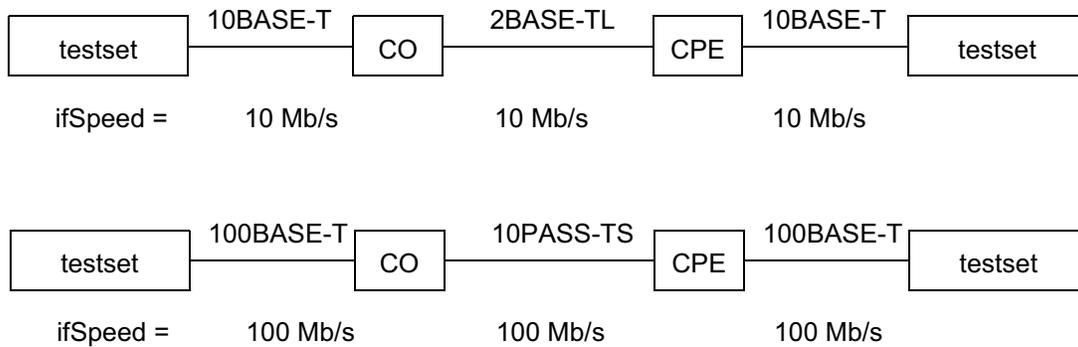

Figure 11–1—Example configuration with no frame loss

Figure 11–2 shows the IEEE 802.3 layering diagram and corresponding use of ifTable and ifMauTable.

Figure 11–2—Use of ifTable and ifMauTable for EFMCu ports

The ifStackTable is indexed by the ifIndex values of the aggregated EFMCu port (PCS) and the PMEs connected to it. ifStackTable allows a Network Management application to determine which PMEs are connected to a particular PCS and change connections (if supported by the application). The ifInvStackTable, being an inverted version of the ifStackTable, provides an efficient means for a Network Management application to read a subset of the ifStackTable and thereby determine which PCS runs on top of a particular PME.

A new table ifCapStackTable, defined in the IF-CAP-STACK-MIB module, specifies for each higher-layer interface (e.g., PCS port) a list of lower-layer interfaces (e.g., PMEs), which can possibly be cross-connected to that higher-layer interface, determined by the cross- connect capability of the device. This table, modeled after ifStackTable, is read-only, reflecting current cross-connect capability of stacked interface, which can be dynamic in some implementations (e.g., if PMEs are located on a pluggable module and the module is pulled out). Note that PME availability per PCS, described by ifCapStackTable, can be constrained by other parameters, for example, by aggregation capacity of a PCS or by the PME in question being already connected to another PCS. So, in order to ensure that a particular PME can be connected to the PCS, all respective parameters (e.g., ifCapStackTable, ifStackTable, and efmCuPAFCapacity) shall be inspected.

The ifInvCapStackTable, also defined in the IF-CAP-STACK-MIB module, describes which higher-layer interfaces (e.g., PCS ports) can possibly be connected to a particular lower-layer interface (e.g., PME), providing an inverted mapping of the ifCapStackTable. While it contains no additional information beyond that already contained in the ifCapStackTable, the ifInvCapStackTable has the ifIndex values in its INDEX clause in the reverse order, i.e., the lower-layer interface first, and the higher-layer interface second, providing an efficient means for a Network Management application to read a subset of the ifCapStackTable and thereby determine which interfaces can be connected to run on top of a particular interface.

11.2.1.2 PME aggregation function (PAF)

The PME aggregation function (PAF) allows a number of PMEs to be aggregated onto a PCS port, by fragmenting the Ethernet frames, transmitting the fragments over multiple PMEs, and assembling the original frames at the remote port. PAF is optional, meaning that a device with a single PME may perform fragmentation and re-assembly if this function is supported by the device. Note that the agent is required to report on the PAF capability for all EFMCu ports (2BASE-TL and 10PASS-TS).

The EFM-CU-MIB module allows a network management application to query the PAF capability and enable/disable it if supported. Note that enabling PAF effectively turns on fragmentation and re-assembly, even on a single-PME port.

11.2.1.3 Discovery operation

The EFMCu ports may optionally support discovery operation, whereby PMEs, during initialization, exchange information about their respective aggregation groups (PCS). This information can then be used to detect copper misconnections or for an automatic assignment of the local PMEs into aggregation groups instead of a fixed pre-configuration.

The MIB modules defined in this clause allow a network management application to control the EFM discovery mechanism and query its results. Note that the discovery mechanism can work only if PAF is supported and enabled.

Two tables are used by the EFM discovery mechanism: ifStackTable and ifCapStackTable. The following pseudo-code gives an example of the discovery and automatic PME assignment for a generic PAF-enabled multi-PCS EFMCu device, located at central office (CO), using objects defined in these MIB modules and in the IF-MIB. (Note that automatic PME assignment is only shown here for the purposes of the example. Fixed PME pre-assignment, manual assignment, or auto-assignment using an alternative internal algorithm may be chosen by a particular implementation.)

```
 // Go over all PCS ports in the CO device
 FOREACH pcs[i] IN CO_device
 { // Perform discovery and auto-assignment only on PAF enabled ports
   // with room for more PMEs
   IF ( pcs[i].PAFSupported AND pcs[i].NumPMEs < pcs[i].PAFCapacity )
   { // Assign a unique 6-octet local discovery code to the PCS
     // e.g., MAC address
     dc = pcs[i].DiscoveryCode = MAC[i];
     // Go over all disconnected PMEs, which can
     // potentially be connected to the PCS
     FOREACH pme[j] IN ifCapStackTable[pcs[i]] AND
                   NOT IN ifStackTable[pcs[i]]  // not connected
     { // Try to grab the remote RT_device, by writing the value
       // of the local 6-octet discovery code to the remote
       // discovery code register (via handshake mechanism).
       // This operation is atomic Set-if-Clear action, i.e., it
       // would succeed only if the remote discovery register was
       // zero. Read the remote discovery code register via Get
       // operation to see if the RT_device, attached via the PME
       // is indeed marked as being the CO_device peer.
       pme[j].RemoteDiscoveryCode = dc;          // Set-if-Clear
       r = pme[j].RemoteDiscoveryCode;           // Get
       IF ( r == dc AND pcs[i].NumPMEs < pcs[i].PAFCapacity)
       { // Remote RT_device connected via PME[j] is/was a peer
```

```
                   // for PCS[i] and there is room for another PME in the
                   // PCS[i] aggregation group (max. PAF capacity is not
                   // reached yet).
                   // Connect this PME to the PCS (via ifStackTable,
                   // ifInvStackTable being inverse of ifStackTable is
                   // updated automatically, i.e., pcs[i] is auto-added
                   // to ifInvStackTable[pme[j]])
                   ADD pme[j] TO ifStackTable[pcs[i]];
                   pcs[i].NumPMEs = pcs[i].NumPMEs + 1;
                   // Discover all other disconnected PMEs,
                   // attached to the same RT_device and connect them to
                   // the PCS provided there is enough room for more PMEs.
                   FOREACH pme[k] IN ifCapStackTable[pcs[i]] AND
                                NOT IN ifStackTable[pcs[i]]
{ // Get Remote Discovery Code from the PME to see if
                   // it belongs to a connected RT_device "grabbed" by
                   // the CO_device.
                   r = pme[k].RemoteDiscoveryCode;
                   IF ( r == dc AND pcs[i].NumPMEs < pcs[i].PAFCapacity)
                   { // Physically connect the PME to the PCS
                     // (pcs[i] is auto-added TO ifInvStackTable[pme[k]])
                     ADD pme[k] TO ifStackTable[pcs[i]];
                     pcs[i].NumPMEs = pcs[i].NumPMEs + 1;
                   }
                 }
               }
               // At this point we have discovered all local PMEs which
               // are physically connected to the same remote RT_device
               // and connected them to PCS[i]. Go to the next PCS.
               BREAK;
           }
       }
   }
```

An SNMP Agent for an EFMCu device builds the ifCapStackTable and its inverse ifInvCapStackTable according to the information contained in the Clause 45 PME_Available_register (see IEEE Std 802.3 61.1.5.3 and 45.2.3.20).

Adding a PME to the ifStackTable row for a specific PCS involves actual connection of the PME to the PCS, which can be done by modifying Clause 45 PME_Aggregate_register (see IEEE Std 802.3 61.1.5.3 and 45.2.3.21).

Note that the PCS port does not have to be operationally 'down' for the connection to succeed. In fact, a dynamic PME addition (and removal) may be implemented with an available PME being initialized first (by setting its ifAdminStatus to 'up') and then added to an operationally 'up' PCS port, by modifying a respective ifStackTable (and respective ifInvStackTable) entry.

It is recommended that a removal of the last operationally 'up' PME from an operationally 'up' PCS would be rejected by the implementation, as this action would completely drop the link.

11.2.1.4 EFMCu ports initialization

EFMCu ports being built on top of xDSL technology require a lengthy initialization or 'training' process, before any data can pass. During this initialization, both ends of a link (peers) work cooperatively to achieve the required data rate on a particular copper pair. Sometimes, when the copper line is too long or the noise on

the line is too high, that 'training' process may fail to achieve a specific target rate with required characteristics.

The ifAdminStatus object from the IF-MIB controls the desired state of a PCS with all the PMEs connected to it or of an individual PME port. Setting this object to 'up' instructs a particular PCS or PME to start the initialization process, which may take tens of seconds for EFMCu ports, especially if PAF is involved. The ifOperStatus object shows the operational state of an interface (extended by the ifMauMediaAvailable object from the MAU-MIB module for PCS and efmCuPmeOperStatus defined in the EFM-CU-MIB module for PME interfaces).

A disconnected PME may be initialized by changing the ifAdminState from 'down' to 'up'. Changing the ifAdminState to 'up' on the PCS initializes all PMEs connected to that particular PCS. Note that in case of PAF some interfaces may fail to initialize while others succeed. The PCS is considered operationally 'up' if at least one PME aggregated by its PAF is operationally 'up'. When all PMEs connected to the PCS are 'down', the PCS shall be considered operationally 'lowerLayerDown'. The PCS shall be considered operationally 'notPresent' if it is not connected to any PME. The PCS/PME interface shall remain operationally 'down' during initialization.

The efmCuPmeOperStatus defined in the EFM-CU-MIB module expands PME's ifOperStatus value of 'down' to 'downReady', 'downNotReady', and 'init' values, indicating various EFMCu PME-specific states.

11.2.1.5 Usage of ifTable

Both PME and PCS interfaces of the EFMCu PHY are managed using interface-specific management objects defined in the EFM-CU-MIB module and generic interface objects from the ifTable of IF-MIB, with all management table entries referenced by the interface index ifIndex.

Table 11–1 summarizes EFMCu-specific interpretations for some of the ifTable objects specified in the mandatory ifGeneralInformationGroup.

Table 11–1—EFMCu interpretation of IF-MIB objects

IF-MIB object	EFMCu interpretation
ifIndex	Interface index. Each PME and each PCS in the EFMCu PHY shall have a unique index, as there are some PCS and PME-specific attributes accessible only on the PCS or PME level.
ifType	ethernetCsmacd(6) for PCS, shdsl(169) for 2BASE-TL PME, vdsl(97) for 10PASS-TS PME. Operating data rate for the PME. For the PCS, it is the sum of the current operating data rates of all PMEs in the aggregation group, without the 64/65-octet encapsulation overhead and PAF overhead, but accounting for the Inter-Frame Gaps (IFGs).
ifSpeed	Setting this object to 'up' instructs a particular PCS (with all PMEs connected to it) or PME to start initialization process.
ifAdminStatus	Setting this object to 'up' instructs a particular PCS (with all PMEs connected to it) or PME to start initialization process.
ifOperStatus	efmCuPmeOperStatus supplements the 'down' value of ifOperStatus for PMEs.

11.2.2 Relation to SHDSL MIB module

G.SHDSL.bis modems, similar to PMEs comprising a 2BASE-TL port, are described in the HDSL2-SHDSL-LINE-MIB module defined in IETF RFC 4319. Note that not all attributes of G.SHDSL modems reflected in the HDSL2-SHDSL-LINE-MIB module have adequate management objects (Clause 30 attributes and Clause 45 registers) in IEEE Std 802.3.

Because of these differences and for the purposes of simplicity, unification of attributes common to both 2BASE-TL and 10PASS-TS PMEs, and name consistency (e.g., prefixing the 2BASE-TL PME related objects with 'efmCuPme2B' instead of 'hdsl2shdsl'), it was decided not to reference HDSL2-SHDSL-LINE-MIB objects, but define all the relevant objects in the EFM-CU-MIB module.

However, if some functionality not available in the EFM-CU-MIB module is required and supported by the PME, e.g., performance monitoring, relevant HDSL2-SHDSL-LINE-MIB groups may be included and applied for PMEs of 2BASE-TL subtype.

11.2.3 Relation to VDSL MIB module

VDSL modems, similar to the PME(s) comprising a 10PASS-TS port, are described in the VDSL-LINE-EXT-MCM-MIB module defined in IETF RFC 4070. Note that not all attributes of VDSL modems reflected in the VDSL-LINE-EXT-MCM-MIB module have adequate management objects (Clause 30 attributes and Clause 45 registers) in IEEE Std 802.3.

Because of these differences and for the purposes of simplicity, unification of attributes common to both 2BASE-TL and 10PASS-TS PMEs, and name consistency, it was decided not to reference VDSL-LINE-EXT-MCM-MIB objects, but define all the relevant objects in the EFM-CU-MIB module.

However, if some functionality not available in the EFM-CU-MIB module is required and supported by the PME, relevant VDSL-LINE-EXT-MCM-MIB groups may be included and applied for PMEs of 10PASS-TS subtype.

11.2.4 Relation to Ethernet-Like and MAU MIB modules

An agent implementing the objects defined in this clause shall also implement the objects required by the Ethernet-like interface MIB module defined in Clause 10 and the objects required by the MAU MIB module defined in Clause 13.

Two new values of ifMauType (OBJECT-IDENTITIES of dot3MauType) and corresponding bit definitions of ifMauTypeListBits (IANAifMauTypeListBits) have been defined in the IANA-MAU-MIB module for EFMCu MAUs:

— dot3MauType2BaseTL and b2BaseTL, for 2BASE-TL MAU
— dot3MauType10PassTS and b10PassTS, for 10PASS-TS MAU

Additionally, the IANA-MAU-MIB module defines two new values of ifMauMediaAvailable, specifically for EFMCu ports: availableReduced and ready (in textual convention IANAifMauMediaAvailable). Due to the PME aggregation, the EFMCu interpretation of some possible ifMauMediaAvailable values differs from other MAUs as follows:

— unknown: the EFMCu interface (PCS with connected PMEs) is Initializing
— ready: the interface is Down, at least one PME in the aggregation group (all PMEs connected to the PCS) is ready for handshake
— available: the interface is Up, all PMEs in the aggregation group are up

— notAvailable: the interface is Down, all PMEs in the aggregation group are Down, no handshake
   tones are detected by any PME
— availableReduced: the interface is Up, a link fault is detected at the receive direction by one or more
   PMEs in the aggregation group, but at least one PME is Up
— pmdLinkFault: a link fault is detected at the receive direction by all PMEs in the aggregation group

As an Ethernet-like interface, every EFMCu port [an ifEntry representing a consolidation of LLC, MAC,
and PCS (sub)layers] shall return an ifType of ethernetCsmacd(6). While most of the MAU characteristics
are not applicable to the EFMCu ports (no Auto-Negotiation, false carriers, or jabber), they shall return an
appropriate ifMauType (dot3MauType2BaseTL or dot3mauType10PassTS) in order to direct the
management software to look in the EFM-CU-MIB module for the desired information. For example, the
information on the particular EFMCu flavor that an EFMCu port is running is available from
efmCuOperSubType, defined in the EFM-CU-MIB module.

Since EFMCu PMEs are not Ethernet-like interfaces, they cannot be instantiated as MAU interface objects.

11.3 MIB structure

11.3.1 EFM copper MIB overview

The main management objects defined in the EFM-CU-MIB module are split into two groups:

— efmCuPort—containing objects for configuration, capabilities, status, and notifications, common to
   all EFMCu PHYs.
— efmCuPme—containing objects for configuration, capabilities, status, and notifications of EFMCu
   PMEs.

The efmCuPme group in turn contains efmCuPme2B and efmCuPme10P groups, which define PME
profiles specific to 2BASE-TL and 10PASS-TS PMEs, respectively, as well as PME-specific status
information.

11.3.2 Interface stack capability MIB overview

The IF-CAP-STACK-MIB module contains two tables:

— ifCapStackTable—containing objects that define possible relationships among the sublayers of an
   interface with flexible cross-connect (cross-connect capability).
— ifInvCapStackTable—an inverse of the ifCapstackTable.

11.3.3 PME profiles

Since a managed node can have a large number of EFMCu PHYs, provisioning every parameter on every
EFMCu PHY may become burdensome. Moreover, most PMEs are provisioned identically with the same set
of parameters. To simplify the provisioning process, the EFM-CU-MIB module makes use of configuration
profiles, similar to the HDSL2-SHDSL-LINE-MIB and VDSL-LINE-EXT-MCM-MIB modules. A profile
is a set of parameters, used either for configuration or representation of a PME. The same profile can be
shared by multiple PME ports using the same configuration.

The PME profiles are defined in the efmCuPme2BProfileTable and efmCuPme10PProfileTable for 2BASE-
TL and 10PASS-TS PMEs, respectively. There are 12 predefined standard profiles for 2BASE-TL and 22
standard profiles for 10PASS-TS, defined in IEEE Std 802.3 and dedicated for rapid provisioning of EFMCu
PHYs in most scenarios. In addition, the EFM-CU-MIB defines two additional predefined profiles for "best-

effort" provisioning of 2BASE-TL PMEs. An ability to define new configuration profiles is also provided to allow for EFMCu deployment tailored to specific copper environments and spectral regulations.

A specific configuration or administrative profile is assigned to a specific PME via the efmCuPmeAdminProfile object. If efmCuPmeAdminProfile is zero, then the efmCuAdminProfile object of the PCS port connected to the PME determines the configuration profile (or a list of possible profiles) for that PME. This mechanism allows specifying a common profile for all PMEs connected to the PCS port, with an ability to change individual PME profiles by setting efmCuPmeAdminProfile object, which overwrites the profile set by efmCuAdminProfile.

A current operating PME profile is pointed to by the efmCuPmeOperProfile object. Note that this profile entry can be created automatically to reflect achieved parameters in adaptive (not fixed) initialization.

11.3.4 Mapping of IEEE 802.3 managed objects

This subclause contains the mapping between relevant managed objects (attributes) defined in IEEE Std 802.3 Clause 30, and managed objects defined in this clause and in associated MIB modules, i.e., the IF-MIB defined in IETF RFC 2863. Note that the majority of the objects defined in the EFM-CU-MIB module do not have direct counterparts in Clause 30 and instead refer to Clause 45 registers.

Table 11–2—Mapping of IEEE 802.3 managed objects

IEEE 802.3 managed object		Corresponding SNMP object
oMAU - Basic Package (Mandatory)	aMAUType	ifMauType (MAU-MIB)
	aMAUTypeList	ifMauTypeListBits (MAU-MIB)
	aMediaAvailable	ifMediaAvailable (MAU-MIB)
oPAF - Basic Package (Mandatory)	aPAFID	ifIndex (IF-MIB)
	aPhyEnd	efmCuPhySide
	aPHYCurrentStatus	efmCuStatus
	aPAFSupported	efmCuPAFSupported

Table 11–2—Mapping of IEEE 802.3 managed objects *(continued)*

IEEE 802.3 managed object		Corresponding SNMP object
oPAF - PME Aggregation Package (Optional)	aPAFAdminState	efmCuPAFAdminState
	aLocalPAFCapacity	efmCuPAFCapacity
	aLocalPMEAvailable	ifCapStackTable
	aLocalPMEAggregate	ifStackTable (IF-MIB)
	aRemotePAFSupported	efmCuRemotePAFSupported
	aRemotePAFCapacity	efmCuRemotePAFCapacity
	aRemotePMEAggregate	
oPME - 10P/2B Package (Mandatory)	aPMEID	ifIndex (IF-MIB)
	aPMEAdminState aPMEStatus	ifAdminState (IF-MIB) efmCuPmeStatus
	aPMESNRMgn	efmCuPmeSnrMgn
	aTCCodingViolations	efmCuPmeTCCodingErrors
	aTCCRCErrors	efmCuPmeTCCrcErrors
	aProfileSelect	efmCuAdminProfile, efmCuPmeAdminProfile
	aOperatingProfile	efmCuPmeOperProfile
	aPMEFECCorrectedBlocks	efmCuPme10PFECCorrectedBlocks
	aPMEFECUncorrectableBlocks	efmCuPme10PFECUncorrectedBlocks

11.4 Security considerations for Ethernet in the First Mile copper interfaces MIB module

There are a number of managed objects defined in the EFM-CU-MIB module that have a MAX-ACCESS clause of read-write or read-create. Most objects are writeable only when the link is Down. Writing to these objects can have potentially disruptive effects on network operation, for example:

— Changing of efmCuPmeAdminSubType may lead to a potential locking of the link, as peer PMEs of the same subtype cannot exchange handshake messages.
— Changing of efmCuPAFAdminState to enabled may lead to a potential locking of the link, if the peer PHY does not support PAF.
— Changing of efmCuPAFDiscoveryCode, before the discovery operation, may lead to a wrongful discovery, for example, when two -O ports are connected to the same multi-PME -R port and both -O ports have the same Discovery register value.
— Changing PCS or PME configuration parameters (e.g., profile of a PCS or PME via efmCuAdminProfile or efmCuPmeAdminProfile) may lead to anything from link quality and rate degradation to a complete link initialization failure, as ability of an EFMCu port to support a particular configuration depends on the copper environment.
— Activation of a PME can cause a severe degradation of service for another EFMCu PHY, whose PME(s) may be affected by the cross-talk from the newly activated PME.
— Removal of a PME from an operationally 'up' EFMCu port, aggregating several PMEs, may cause port's rate degradation.

The user of the EFM-CU-MIB module should therefore be aware that support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

The readable objects in the EFM-CU-MIB module (i.e., those with MAX-ACCESS other than not-accessible) may be considered sensitive in some environments since, collectively, they provide information about the performance of network interfaces and can reveal some aspects of their configuration. In particular, since EFMCu can be carried over Unshielded Twisted Pair (UTP) voice-grade copper in a bundle with other pairs belonging to another operator/customer, it is theoretically possible to eavesdrop to an EFMCu transmission simply by "listening" to a cross-talk from the EFMCu pairs, especially if the parameters of the EFMCu link in question are known.

In such environments, it is important to control also GET and NOTIFY access to these objects and possibly to encrypt their values when sending them over the network via SNMP.

11.5 MIB module definition

An ASCII text version of the MIB definition can be found at the following URL:[18]

http://www.ieee802.org/3/be/public/mib_modules/20110202/802dot3dot1C11mib.txt

ifCapStackTable  OBJECT-TYPE
  SYNTAX      SEQUENCE OF IfCapStackEntry
  MAX-ACCESS  not-accessible
  STATUS      current
  DESCRIPTION
    "This table, modeled after ifStackTable from IF-MIB,
    contains information on the possible 'on-top-of'
    relationships between the multiple sub-layers of network
    interfaces (as opposed to actual relationships described in
    ifStackTable). In particular, it contains information on
    which sub-layers may possibly run 'on top of' which other
    sub-layers, as determined by cross-connect capability of the
    device, where each sub-layer corresponds to a conceptual row
    in the ifTable. For example, when the sub-layer with ifIndex
    value x can be connected to run on top of the sub-layer with
    ifIndex value y, then this table contains:

      ifCapStackStatus.x.y=true

    The ifCapStackStatus.x.y row does not exist if it is
    impossible to connect between the sub-layers x and y.

    Note that for most stacked interfaces (e.g., 2BASE-TL)
    there's always at least one higher-level interface (e.g., PCS
    port) for each lower-level interface (e.g., PME) and at
    least one lower-level interface for each higher-level
    interface, that is, there is at least a single row with a
    'true' status for any such existing value of x or y.

    This table is read-only as it describes device capabilities."

IfCapStackEntry ::= SEQUENCE {
    ifCapStackStatus      TruthValue
   }

ifCapStackStatus  OBJECT-TYPE
  SYNTAX      TruthValue
  MAX-ACCESS  read-only
  STATUS      current
```

```
    DESCRIPTION
      "The status of the 'cross-connect capability' relationship
      between two sub-layers. The following values can be returned:
        true(1)          - indicates that the sub-layer interface,
                           identified by the ifStackLowerLayer may
                           be connected to run 'below' the sub-layer
                           interface, identified by the
                           ifStackHigherLayer index.
        false(2)         - the sub-layer interfaces cannot be
                           connected temporarily due to
                           unavailability of the interface(s), e.g.,
                           one of the interfaces is located on an
                           absent pluggable module.

      Note that lower-layer interface availability per higher-layer,
      indicated by the value of 'true', can be constrained by
      other parameters, for example, by the aggregation capacity of
      a higher-layer interface or by the lower-layer interface in
      question being already connected to another higher-layer
      interface. In order to ensure that a particular sub-layer can
      be connected to another sub-layer, all respective objects
      (e.g., ifCapStackTable, ifStackTable, and efmCuPAFCapacity for
      EFMCu interfaces) shall be inspected.

      This object is read-only, unlike ifStackStatus, as it
      describes a cross-connect capability."
    ::= { ifCapStackEntry 1 }

ifInvCapStackStatus  OBJECT-TYPE
   SYNTAX        TruthValue
   MAX-ACCESS    read-only
   STATUS        current
   DESCRIPTION
      "The status of the possible 'cross-connect capability'
      relationship between two sub-layers.

      An instance of this object exists for each instance of the
      ifCapStackStatus object, and vice versa. For example, if the
      variable ifCapStackStatus.H.L exists, then the variable
      ifInvCapStackStatus.L.H also exists, and vice versa. In
      addition, the two variables always have the same value.

      The ifInvCapStackStatus object is read-only, as it describes
      a cross-connect capability."

         DISPLAY-HINT "d"
         STATUS       current
         DESCRIPTION
           "A unique value, greater than zero, for each PME configuration
            profile in the managed EFMCu port. Values should be assigned
            contiguously starting from 1. The value for each profile shall
            remain constant at least from one re-initialization of the
            entity's network management system to the next re-initialization."
```

```
              SYNTAX        Unsigned32 (1..255)

        EfmProfileIndexOrZero ::= TEXTUAL-CONVENTION
          DISPLAY-HINT "d"
          STATUS        current
          DESCRIPTION
            "This textual convention is an extension of the
            EfmProfileIndex convention. The latter defines a greater than
            zero value used to identify a PME profile in the managed EFMCu
            port. This extension permits the additional value of zero.
            The value of zero is object-specific and shall therefore be
            defined as part of the description of any object that uses
            this syntax.
            Examples of the usage of zero value might include situations
            where the current operational profile is unknown."
          SYNTAX        Unsigned32 (0..255)

        EfmProfileIndexList ::= TEXTUAL-CONVENTION
          DISPLAY-HINT "1d:"

          STATUS        current
          DESCRIPTION
            "This textual convention represents a list of up to 6
            EfmProfileIndex values, any of which can be chosen for
            configuration of a PME in a managed EFMCu port.
            The EfmProfileIndex textual convention defines a greater than
            zero value used to identify a PME profile.
            The value of this object is a concatenation of zero or
            more (up to 6) octets, where each octet contains an 8-bit
            EfmProfileIndex value.
            A zero-length octet string is object-specific and shall
            therefore be defined as part of the description of any object
            that uses this syntax. Examples of the usage of a zero-length
            value might include situations where an object using this
            textual convention is irrelevant for a specific EFMCu port
            type."
          SYNTAX        OCTET STRING (SIZE(0..6))

       EfmTruthValueOrUnknown ::= TEXTUAL-CONVENTION
          STATUS        current
          DESCRIPTION
            "This textual convention is an extension of the TruthValue
            convention. The latter defines a boolean value with possible
            values of true(1) and false(2). This extension permits the
            additional value of unknown(0), which can be returned as the
            result of a GET operation when an exact true or false value
            of the object cannot be determined."
          SYNTAX        INTEGER { unknown(0), true(1), false(2) }

      -- Port Notifications Group

      efmCuPortNotifications OBJECT IDENTIFIER ::= { efmCuPort 0 }

      efmCuLowRateCrossing NOTIFICATION-TYPE
        OBJECTS {
          ifSpeed,
          efmCuThreshLowRate
        }
        STATUS        current
```

```
            DESCRIPTION
              "This notification indicates that the EFMCu port's data rate
              has reached/dropped below or exceeded the low rate threshold,
              specified by efmCuThreshLowRate.

              This notification may be sent for the -O subtype ports
              (2BaseTL-O/10PassTS-O) while the port is Up, on the crossing
              event in both directions: from normal (rate is above the
              threshold) to low (rate equals the threshold or below it) and
              from low to normal. This notification is not applicable to
              the -R subtypes.

              A small debouncing period of 2.5 sec, between the detection
              of the condition and the notification, should be implemented to
              prevent simultaneous LinkUp/LinkDown and efmCuLowRateCrossing
              notifications to be sent.

              The adaptive nature of the EFMCu technology allows the port to
              adapt itself to the changes in the copper environment, e.g.,
              an impulse noise, alien crosstalk, or a micro-interruption may
              temporarily drop one or more PMEs in the aggregation group,
              causing a rate degradation of the aggregated EFMCu link.
              The dropped PMEs would then try to re-initialize, possibly at
              a lower rate than before, adjusting the rate to provide
              required target SNR margin.

              Generation of this notification is controlled by the
              efmCuLowRateCrossingEnable object."
            ::= { efmCuPortNotifications 1 }

      }

efmCuPAFAdminState  OBJECT-TYPE
   SYNTAX       INTEGER {
     enabled(1),
     disabled(2)
   }
   MAX-ACCESS  read-write
   STATUS      current
   DESCRIPTION
     "Administrative (desired) state of the PAF of the EFMCu port
     (PCS).
     When 'disabled', PME aggregation will not be performed by the
     PCS. No more than a single PME can be assigned to this PCS in
     this case.
     When 'enabled', PAF will be performed by the PCS when the link
     is Up, even on a single attached PME, if PAF is supported.

     PCS ports incapable of supporting PAF shall return a value of
     'disabled'. Attempts to 'enable' such ports shall be
     rejected.

     A PAF 'enabled' port with multiple PMEs assigned cannot be
     'disabled'. Attempts to 'disable' such port shall be
     rejected, until at most one PME is left assigned.

     Changing PAFAdminState is a traffic-disruptive operation and
     as such shall be done when the link is Down. Attempts to
     change this object shall be rejected if the link is Up or
     Initializing.

     This object maps to the Clause 30 attribute aPAFAdminState.

     If a Clause 45 MDIO Interface to the PCS is present, then this
     object maps to the PAF enable bit in the 10P/2B PCS control
     register.

     This object shall be maintained in a persistent manner."

efmCuPAFDiscoveryCode  OBJECT-TYPE
   SYNTAX       PhysAddress (SIZE(0|6))
   MAX-ACCESS  read-write
   STATUS      current
   DESCRIPTION
     "PAF Discovery Code of the EFMCu port (PCS).
     A unique 6-octet code used by the Discovery function,
     when PAF is supported.
     PCS ports incapable of supporting PAF shall return a
     zero-length octet string on an attempt to read this object.
     An attempt to write to this object shall be rejected for such
     ports.
     This object shall be instantiated for the -O subtype PCS before
```

writing operations on the efmCuPAFRemoteDiscoveryCode
(Set_if_Clear and Clear_if_Same) are performed by PMEs
associated with the PCS.
The initial value of this object for -R subtype ports after
reset is all zeroes. For -R subtype ports, the value of this
object cannot be changed directly. This value may be changed
as a result of writing operation on the
efmCuPAFRemoteDiscoveryCode object of remote PME of -O
subtype, connected to one of the local PMEs associated with
the PCS.

Discovery shall be performed when the link is Down.
Attempts to change this object shall be rejected (in case of
SNMP with the error inconsistentValue), if the link is Up or
Initializing.

The PAF Discovery Code maps to the local Discovery code
variable in PAF (note that it does not have a corresponding
Clause 45 register)."

  ::= { efmCuPortConfEntry 2 }

efmCuAdminProfile   OBJECT-TYPE
  SYNTAX   EfmProfileIndexList
  MAX-ACCESS   read-write
  STATUS   current
  DESCRIPTION
    "Desired configuration profile(s), common for all PMEs in the
    EFMCu port. This object is a list of pointers to entries in
    either efmCuPme2BProfileTable or
    efmCuPme10PProfileTable, depending on the current
    operating SubType of the EFMCu port as indicated by
    efmCuPortSide.
    The value of this object is a list of up to 6 indices of
    profiles. If this list consists of a single profile index,
    then all PMEs assigned to this EFMCu port shall be configured
    according to the profile referenced by that index, unless it
    is overwritten by a corresponding non-zero
    efmCuPmeAdminProfile instance, which takes precedence over
    efmCuAdminProfile.
    A list consisting of more than one index allows each PME
    in the port to be configured according to any profile
    specified in the list.
    By default, this object has a value of 0x01, referencing the
    1st entry in efmCuPme2BProfileTable or
    efmCuPme10PProfileTable.

    This object is writable and readable for the -O subtype
    (2BaseTL-O or 10PassTS-O) EFMCu ports. It is irrelevant for
    the -R subtype (2BaseTL-R or 10PassTS-R) ports -- a
    zero-length octet string shall be returned on an attempt to
    read this object and an attempt to change this object shall be
    rejected in this case.

    Note that the current operational profile value is available
    via the efmCuPmeOperProfile object.

Any modification of this object shall be performed when the
link is Down. Attempts to change this object shall be
rejected, if the link is Up or Initializing.
Attempts to set this object to a list with a member value that
is not the value of the index for an active entry in the
corresponding profile table shall be rejected.

This object maps to the Clause 30 attribute aProfileSelect.

This object shall be maintained in a persistent manner."

  DEFVAL { '01'H }
  ::= { efmCuPortConfEntry 3 }

efmCuTargetDataRate OBJECT-TYPE
  SYNTAX   Unsigned32(1..100000|999999)
  UNITS   "Kbps"
  MAX-ACCESS   read-write
  STATUS   current
  DESCRIPTION
    "Desired EFMCu port 'net' (as seen across MII) Data Rate in
    kb/s, to be achieved during initialization, under spectral
    restrictions placed on each PME via efmCuAdminProfile or
    efmCuPmeAdminProfile, with the desired SNR margin specified by
    efmCuTargetSnrMgn.
    In case of PAF, this object represents a sum of individual PME
    data rates, modified to compensate for fragmentation and
    64/65-octet encapsulation overhead (e.g., target data rate of
    10 Mb/s shall allow lossless transmission of a full-duplex
    10 Mb/s Ethernet frame stream with minimal inter-frame gap).

    The value is limited above by 100 Mb/s as this is the max
    burst rate across MII for EFMCu ports.

    The value between 1 and 100000 indicates that the total data
    rate (ifSpeed) of the EFMCu port after initialization shall be
    equal to the target data rate or less, if the target data rate
    cannot be achieved under spectral restrictions specified by
    efmCuAdminProfile/efmCuPmeAdminProfile and with the desired
    SNR margin. In case the copper environment allows a higher
    total data rate to be achieved than that specified by the
    target, the excess capability shall be either converted to
    additional SNR margin or reclaimed by minimizing transmit
    power as controlled by efmCuAdaptiveSpectra.

    The value of 999999 means that the target data rate is not
    fixed and shall be set to the maximum attainable rate during
    initialization (Best Effort), under specified spectral
    restrictions and with the desired SNR margin.

    This object is read-write for the -O subtype EFMCu ports
    (2BaseTL-O/10PassTS-O) and not available for the -R subtypes.

    Changing of the Target Data Rate shall be performed when the
    link is Down. Attempts to change this object shall be rejected
    (in case of SNMP with the error inconsistentValue), if the
    link is Up or Initializing.

```
        Note that the current Data Rate of the EFMCu port is
        represented by the ifSpeed object of IF-MIB.

        This object shall be maintained in a persistent manner."
      ::= { efmCuPortConfEntry 4 }

    efmCuTargetSnrMgn  OBJECT-TYPE
      SYNTAX      Unsigned32(0..21)
      UNITS       "dB"
      MAX-ACCESS  read-write
      STATUS      current
      DESCRIPTION
        "Desired EFMCu port SNR margin to be achieved on all PMEs
        assigned to the port, during initialization. (The SNR margin
        is the difference between the desired SNR and the actual SNR).

        Note that 802.3ah recommends using a default target SNR margin
        of 5 dB for 2BASE-TL ports and 6 dB for 10PASS-TS ports in
        order to achieve a mean bit error ratio (BER) of 10^-7 at the
        PMA service interface.

        This object is read-write for the -O subtype EFMCu ports
        (2BaseTL-O/10PassTS-O) and not available for the -R subtypes.

        Changing of the target SNR margin shall be performed when the
        link is Down. Attempts to change this object shall be rejected
        (in case of SNMP with the error inconsistentValue), if the
        link is Up or Initializing.

        Note that the current SNR margin of the PMEs comprising the
        EFMCu port is represented by efmCuPmeSnrMgn.

        This object shall be maintained in a persistent manner."

    efmCuAdaptiveSpectra  OBJECT-TYPE
      SYNTAX      TruthValue
      MAX-ACCESS  read-write
      STATUS      current
      DESCRIPTION
        "Indicates how to utilize excess capacity when the copper
        environment allows a higher total data rate to be achieved
        than that specified by the efmCuTargetDataRate.

        A value of true(1) indicates that the excess capability shall
        be reclaimed by minimizing transmit power, e.g., using higher
        constellations and Power Back-Off, in order to reduce
        interference to other copper pairs in the binder and the
        adverse impact to link/system performance.

        A value of false(2) indicates that the excess capability shall
        be converted to additional SNR margin and spread evenly across
        all active PMEs assigned to the (PCS) port, to increase link
        robustness.

        This object is read-write for the -O subtype EFMCu ports
        (2BaseTL-O/10PassTS-O) and not available for the -R subtypes.
```

    Changing of this object shall be performed when the link is
    Down. Attempts to change this object shall be rejected (in
    case of SNMP with the error inconsistentValue), if the link
    is Up or Initializing.

    This object shall be maintained in a persistent manner."

  STATUS      current
  DESCRIPTION
    "EFMCu (PCS) port Fault Status. This is a bitmap of possible
    conditions. The various bit positions are:
      noPeer               - the peer PHY cannot be reached (e.g.,
                             no PMEs attached, all PMEs are Down,
                             etc.). More info is available in
                             efmCuPmeFltStatus.
      peerPowerLoss        - the peer PHY has indicated impending
                             unit failure due to loss of local
                             power ('Dying Gasp').
      pmeSubTypeMismatch   - local PMEs in the aggregation group
                             are not of the same subtype, e.g.,
                             some PMEs in the local device are -O
                             while others are -R subtype.
      lowRate              - ifSpeed of the port reached or dropped
                             below efmCuThreshLowRate.

    This object is intended to supplement the ifOperStatus object
    in IF-MIB and ifMauMediaAvailable in the MAU-MIB module.

    Additional information is available via the efmCuPmeFltStatus
    object for each PME in the aggregation group (single PME if
    PAF is disabled)."

  STATUS       current
  DESCRIPTION
    "Administrative (desired) subtype of the PME.
    Possible values are:
      ieee2BaseTLO           - PME shall operate as 2BaseTL-O
      ieee2BaseTLR           - PME shall operate as 2BaseTL-R
      ieee10PassTSO          - PME shall operate as 10PassTS-O
      ieee10PassTSR          - PME shall operate as 10PassTS-R
      ieee2BaseTLor10PassTSR - PME shall operate as 2BaseTL-R or
                               10PassTS-R. The actual value will
                               be set by the -O link partner
                               during initialization (handshake).
      ieee2BaseTLor10PassTSO - PME shall operate as 2BaseTL-O
                               (preferred) or 10PassTS-O. The
                               actual value will be set during
                               initialization depending on the -R
                               link partner capability (i.e., if
                               -R is incapable of the preferred
                               2BaseTL mode, 10PassTS will be
                               used).
      ieee10PassTSor2BaseTLO - PME shall operate as 10PassTS-O
                               (preferred) or 2BaseTL-O. The
                               actual value will be set during
                               initialization depending on the -R
                               link partner capability (i.e., if
                               -R is incapable of the preferred
                               10PassTS mode, 2BaseTL will be
                               used).

    Changing efmCuPmeAdminSubType is a traffic-disruptive
    operation and as such shall be done when the link is Down.
    Attempts to change this object shall be rejected if the link
    is Up or Initializing.
    Attempts to change this object to an unsupported subtype
    (see efmCuPmeSubTypesSupported) shall be rejected.

    The current operational subtype is indicated by the
    efmCuPmeOperSubType variable.

    If a Clause 45 MDIO Interface to the PMA/PMD is present, then
    this object combines values of the Port subtype select bits
    and the PMA/PMD type selection bits in the 10P/2B PMA/PMD
    control register."

efmCuPmeAdminProfile  OBJECT-TYPE
  SYNTAX       EfmProfileIndexOrZero
  MAX-ACCESS   read-write
  STATUS       current
  DESCRIPTION
    "Desired PME configuration profile. This object is a pointer
    to an entry in either the efmCuPme2BProfileTable or the
    efmCuPme10PProfileTable, depending on the current operating
    SubType of the PME. The value of this object is the index of
    the referenced profile.
    The value of zero (default) indicates that the PME is
    configured via the efmCuAdminProfile object for the PCS port
    to which this PME is assigned. That is, the profile
    referenced by efmCuPmeAdminProfile takes precedence
    over the profile(s) referenced by efmCuAdminProfile.

    This object is writable and readable for the CO subtype PMEs
    (2BaseTL-O or 10PassTS-O). It is irrelevant for the CPE
    subtype (2BaseTL-R or 10PassTS-R) -- a zero value shall be
    returned on an attempt to read this object and any attempt
    to change this object shall be rejected in this case.
    Note that the current operational profile value is available
    via efmCuPmeOperProfile object.

    Any modification of this object shall be performed when the
    link is Down. Attempts to change this object shall be
    rejected, if the link is Up or Initializing.

    Attempts to set this object to a value that is not the value
    of the index for an active entry in the corresponding profile
    table shall be rejected.

    This object maps to the Clause 30 attribute aProfileSelect.

    This object shall be maintained in a persistent manner."

efmCuPAFRemoteDiscoveryCode  OBJECT-TYPE
  SYNTAX       PhysAddress (SIZE(0|6))
  MAX-ACCESS   read-write
  STATUS       current
  DESCRIPTION
    "PAF Remote Discovery Code of the PME port at the CO.
    The 6-octet Discovery Code of the peer PCS connected via
    the PME.
    Reading this object results in a Discovery Get operation.
    Setting this object to all zeroes results in a Discovery
    Clear_if_Same operation (the value of efmCuPAFDiscoveryCode
    at the peer PCS shall be the same as efmCuPAFDiscoveryCode of
    the local PCS associated with the PME for the operation to
    succeed).
    Writing a non-zero value to this object results in a
    Discovery Set_if_Clear operation.
    A zero-length octet string shall be returned on an attempt to
    read this object when PAF aggregation is not enabled.
```

```
   This object is irrelevant in CPE port (-R) subtypes: in this
   case, a zero-length octet string shall be returned on an
   attempt to read this object; writing to this object shall
   be rejected.

   Discovery shall be performed when the link is Down.
   Attempts to change this object shall be rejected (in case of
   SNMP with the error inconsistentValue), if the link is Up or
   Initializing.

   If a Clause 45 MDIO Interface to the PMA/PMD is present, then
   this object is a function of 10P/2B aggregation discovery
   control register, Discovery operation result bits in 10P/2B
   aggregation and discovery status register and
   10P/2B aggregation discovery code register."

   DESCRIPTION
      "Current/Last PME link Fault Status. This is a bitmap of
      possible conditions. The various bit positions are:
```

```
        lossOfFraming       - Loss of Framing for 10P or
                              Loss of Sync word for 2B PMD or
                              Loss of 64/65-octet framing.
        snrMgnDefect        - SNR margin dropped below the
                              threshold.
        lineAtnDefect       - Line Attenuation exceeds the
                              threshold.
        deviceFault         - Indicates a vendor-dependent
                              diagnostic or self-test fault
                              has been detected.
        configInitFailure   - Configuration initialization failure,
                              due to inability of the PME link to
                              support the configuration profile,
                              requested during initialization.
        protocolInitFailure - Protocol initialization failure, due
                              to an incompatible protocol used by
                              the peer PME during init (that could
                              happen if a peer PMD is a regular
                              G.SDHSL/VDSL modem instead of a
                              2BASE-TL/10PASS-TS PME).

      This object is intended to supplement ifOperStatus in IF-MIB.

      This object holds information about the last fault.
      efmCuPmeFltStatus is cleared by the device restart.
      In addition, lossOfFraming, configInitFailure, and
      protocolInitFailure are cleared by PME init;
      deviceFault is cleared by successful diagnostics/test;
      snrMgnDefect and lineAtnDefect are cleared by SNR margin
      and Line attenuation, respectively, returning to norm and by
      PME init.

      This object partially maps to the Clause 30 attribute
      aPMEStatus.

      If a Clause 45 MDIO Interface to the PME is present, then this
      object consolidates information from various PMA/PMD
      registers, namely: Fault bit in PMA/PMD status 1 register,
      10P/2B PMA/PMD link loss register,
      10P outgoing indicator bits status register,
      10P incoming indicator bits status register,
      2B state defects register."

12. Ethernet wide area network (WAN) interface sublayer (WIS) MIB module

This clause defines a portion of the Management Information Base (MIB) for use with SNMP. In particular, it defines objects for managing IEEE Std 802.3 WAN interface sublayers.

12.1 Overview

The objects defined in this clause are used in conjunction with objects defined in the Interfaces Group MIB in IETF RFC 2863, the SONET/SDH Interface MIB in IETF RFC 3592, and the IEEE 802.3 MAU MIB defined in Clause 13 of this document to manage the Ethernet WAN interface sublayer (WIS) defined in IEEE Std 802.3. The WIS contains functions to perform OC-192c/VC-4-64c framing and scrambling. It resides between the Physical Coding Sublayer (PCS) and the Physical Medium Attachment (PMA) sublayer within a 10GBASE-W 10 Gb/s WAN-compatible physical layer device (PHY) and may be used in conjunction with any of the PCS, PMA, and Physical Medium Dependent (PMD) sublayers defined in IEEE Std 802.3 for 10GBASE-W PHYs. Three types of 10GBASE-W PHYs are defined, distinguished by the type of optics employed: 10GBASE-SW, 10GBASE-LW, and 10GBASE-EW. The objects defined in this clause may be used to manage an Ethernet interface employing any type of 10GBASE-W PHY. They do not apply to any other kind of interface. In particular, they do not apply to so-called Ethernet Line Terminating Equipment (ELTE) residing within a SONET network element that uses the 10GBASE-W PMA/PMD sublayers but otherwise acts as SONET Line Terminating Equipment (LTE).

The objects presented here—along with those incorporated by reference from the Interfaces Group MIB, the SONET/SDH Interface MIB, and the IEEE 802.3 MAU MIB—are intended to provide exact representations of the mandatory attributes in the oWIS managed object class (i.e., the members of the pWISBasic package) defined in Clause 30 of IEEE Std 802.3. They are also intended to provide approximate representations of the optional attributes (i.e., the members of the pWISOptional package). Some objects with no analogues in oWIS are defined to support WIS testing features required by Clause 50 of IEEE Std 802.3.

12.1.1 Relationship to the SONET/SDH interface MIB

Since the Ethernet WAN interface sublayer was designed to be SONET- compatible, information similar to that provided by most of the members of the oWIS managed object class is available from objects defined in the SONET-MIB in IETF RFC 3592. Thus, the MIB module defined in this clause is a sparse augmentation of the SONET-MIB—in other words, every table defined here is an extension of some table in the SONET-MI—and its compliance statement REQUIRES that an agent implementing the objects defined in this clause also implement the relevant SONET-MIB objects. That includes all objects required by sonetCompliance2 as well as some that it leaves optional.

It should be noted that some of the objects incorporated by reference from the SONET-MIB—specifically, the threshold objects and interval counter objects—provide only approximate representations of the corresponding oWIS attributes, as detailed in 12.1.6. An alternative approach would have been to define new objects to exactly match the oWIS definitions. That approach was rejected because the SONET-MIB objects are already used in deployed systems to manage the SONET sublayers of ATM over SONET and PPP over SONET interfaces, and it was deemed undesirable to use a different scheme to manage the SONET sublayers of 10 Gb/s WAN-compatible Ethernet interfaces. Note that the approach adopted by this clause requires no hardware support beyond that mandated by 50.3.11 of IEEE Std 802.3.

12.1.2 Relationship to the Ethernet-like interface MIB

An interface that includes the Ethernet WIS is, by definition, an Ethernet-like interface, and an agent implementing the objects defined in this clause shall also implement the objects required by the Ethernet-like interface MIB module defined in Clause 10.

12.1.3 Relationship to the IEEE 802.3 MAU MIB

Support for the mauModIfCompl3 compliance statement of the MAU-MIB module defined in Clause 13 is required for all Ethernet-like interfaces. The MAU-MIB module is needed in order to allow applications to control and/or determine the media type in use; this is important for devices that can support both the 10GBASE-R 10 Gb/s LAN format (which does not include the WIS) and the 10GBASE-W 10 Gb/s WAN format (which does include the WIS). The MAU-MIB module also provides the means to put a device in standby mode or to reset it; the latter may be used to re-initialize the WIS.

12.1.4 Use of the ifTable

This subclause specifies how the ifTable, as defined in IETF RFC 2863, is used for the Ethernet WIS application.

12.1.4.1 Layering model

Ethernet interfaces that employ the WIS are layered as defined in IEEE Std 802.3. The corresponding use of the ifTable defined in IETF RFC 2863 is shown in Figure 12–1.
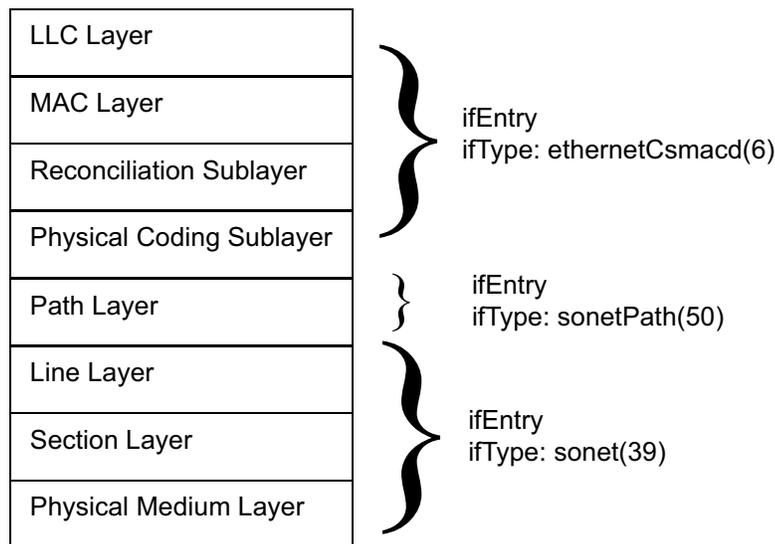

Figure 12–1—Use of ifTable for an Ethernet WIS port

The exact configuration and multiplexing of the layers is maintained in the ifStackTable in IETF RFC 2863 and in the ifInvStackTable in IETF RFC 2864.

12.1.4.2 Use of ifTable for LLC layer/MAC sublayer/reconciliation sublayer/physical coding sublayer

The ifTable shall be used as specified in Clause 10 and Clause 13 for the LLC Layer/MAC sublayer/reconciliation sublayer/physical coding sublayer.

12.1.4.3 Use of ifTable for SONET/SDH path layer

The ifTable shall be used as specified in IETF RFC 3592 for the SONET/SDH path layer. The value of ifHighSpeed is set to 9585. ifSpeed reports a value of 4294967295.

12.1.4.4 Use of ifTable for SONET/SDH medium/section/line layer

The ifTable shall be used as specified in IETF RFC 3592 for the SONET/SDH Medium/Section/Line Layer. The value of ifHighSpeed is set to 9953. ifSpeed reports a value of 4294967295.

12.1.5 SONET/SDH terminology

The SONET/SDH terminology used in IEEE Std 802.3 is mostly the same as in IETF RFC 3592, but there are a few differences. In those cases, the definitions in Clause 3 take precedence.

12.1.6 Mapping of IEEE 802.3 managed objects

Table 12–1 contains the mapping between oWIS managed objects in the pWIS Basic package defined in IEEE Std 802.3 and managed objects defined in this clause and in associated MIB modules, i.e., the IF-MIB in IETF RFC 2863, the SONET-MIB in IETF RFC 3592, and the IEEE 802.3 MAU-MIB module defined in Clause 13 of this document.

Table 12–1—Mapping of IEEE 802.3 managed objects (pWIS Basic package)

IEEE 802.3 managed object		Corresponding SNMP object
oWIS - pWISBasic package	aWISID	IF-MIB - ifIndex
	aSectionStatus	SONET-MIB - sonetSectionCurrentStatus
	aLineStatus	SONET-MIB - sonetLineCurrentStatus
	aPathStatus	etherWisPathCurrentStatus
	aFarEndPathStatus	etherWisFarEndPathCurrentStatus

The Unequipped defect is not defined by IEEE Std 802.3.

Table 12–2 contains the same mapping information for the pWIS optional package.

The threshold and counter objects imported from the SONET-MIB are not completely equivalent to the corresponding IEEE 802.3 objects. The specific differences are presented in Table 12–3. Despite the semantic differences between the threshold objects and counter objects imported from the SONET-MIB and the corresponding IEEE 802.3 objects, the hardware support mandated by 50.3.11 of IEEE Std 802.3 suffices for both. See Annex 12A for details.

Table 12–2—Mapping of IEEE 802.3 managed objects (pWIS optional package)

IEEE 802.3 managed object		Corresponding SNMP object
oWIS – pWISOptional package	aSectionSESThreshold	SONET-MIB – sonetSESthresholdSe
	aSectionSESs	SONET-MIB – sonetSectionCurrentSESs + sonetSectionIntervalSESs
	aSectionESs	SONET-MIB – sonetSectionCurrentESs + sonetSectionIntervalESs
	aSectionSEFSs	SONET-MIB – sonetSectionCurrentSEFSs + sonetSectionIntervalSEFSs
	aSectionCVs	SONET-MIB – sonetSectionCurrentCVs + sonetSectionIntervalCVs
	aJ0ValueTX	etherWisSectionCurrentJ0Transmitted
	aJ0ValueRX	etherWisSectionCurrentJ0Received
	aLineSESThreshold	SONET-MIB – sonetSESthresholdSet
	aLineSESs	SONET-MIB – sonetLineCurrentSESs + sonetLineIntervalSESs
	aLineESs	SONET-MIB – sonetLineCurrentESs + sonetLineIntervalESs
	aLineCVs	SONET-MIB – sonetLineCurrentCVs + sonetLineIntervalCVs
	aFarEndLineSESs	SONET-MIB – sonetFarEndLineCurrentSESs + sonetFarEndLineIntervalSESs
	aFarEndLineESs	SONET-MIB – sonetFarEndLineCurrentESs + sonetFarEndLineIntervalESs
	aFarEndLineCVs	SONET-MIB – sonetFarEndLineCurrentCVs + sonetFarEndLineIntervalCVs
	aPathSESThreshold	SONET-MIB – sonetSESthresholdSet
	aPathSESs	SONET-MIB – sonetPathCurrentSESs + sonetPathIntervalSESs
	aPathESs	SONET-MIB – sonetPathCurrentESs + sonetPathIntervalESs
	aPathCVs	SONET-MIB – sonetPathCurrentCVs + sonetPathIntervalCVs
	aJ1ValueTX	etherWisPathCurrentJ1Transmitted

Table 12–2—Mapping of IEEE 802.3 managed objects (pWIS optional package) *(continued)*

IEEE 802.3 managed object		Corresponding SNMP object
oWIS - pWISOptional package (continued)	aJ1ValueRX	etherWisPathCurrentJ1Received
	aFarEndPathSESs	SONET-MIB – sonetFarEndPathCurrentSESs + sonetFarEndPathIntervalSESs
	aFarEndPathESs	SONET-MIB – sonetFarEndPathCurrentESs + sonetFarEndPathIntervalESs
	aFarEndPathCVs	SONET-MIB – sonetFarEndPathCurrentCVs + sonetFarEndPathIntervalCVs

Table 12–3—IEEE 802.3 managed object and SNMP object differences

IEEE 802.3 managed object	How corresponding SNMP object differs
aSectionSESThreshold	This object is defined in IEEE Std 802.3 as an integer with one instance per interface. sonetSESthresholdSet is an enumerated value that has one instance per network element; it controls the thresholds for all layers simultaneously and allows only certain discrete values to be selected.
aSectionSESs	This object is defined in IEEE Std 802.3 as a generalized nonresettable counter. The objects sonetSectionCurrentSES and sonetSectionIntervalSESs are 15-minute interval counters.
aSectionESs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3. The objects sonetSectionCurrentESs and sonetSectionIntervalESs are 15-minute interval counters.
aSectionSEFSs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3. The objects sonetSectionCurrentSEFSs and sonetSectionIntervalSEFSs are 15-minute interval counters.
aSectionCVs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetSectionCurrentCVs and sonetSectionInterval-CVs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify as severely errored seconds.
aLineSESThreshold	This object is defined in IEEE Std 802.3 as an integer with one instance per interface. sonetSESthresholdSet is an enumerated value that has one instance per network element; it controls the thresholds for all layers simultaneously and allows only certain discrete values to be selected.
aLineSESs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetLineCurrentSESs and sonetLineIntervalSESs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify as unavailable seconds.
aLineESs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetLineCurrentESs and sonetLineIntervalESs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify as unavailable seconds.

Table 12–3—IEEE 802.3 managed object and SNMP object differences *(continued)*

IEEE 802.3 managed object	How corresponding SNMP object differs
aLineCVs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetLineCurrentCVs and sonetLineIntervalCVs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify either as severely errored seconds or as unavailable seconds.
aFarEndLineSESs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetFarEndLineCurrentSESs and sonetFarEndLineIntervalSESs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify as unavailable seconds
aFarEndLineESs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetFarEndLineCurrentESs and sonetFarEndLineIntervalESs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify as unavailable seconds.
aFarEndLineCVs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetFarEndLineCurrentCVs and sonetFarEndLineIntervalCVs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify either as severely errored seconds or as unavailable seconds.
aPathSESThreshold	This object is defined in IEEE Std 802.3 as an integer with one instance per interface. sonetSESthresholdSet is an enumerated value that has one instance per network element; it controls the thresholds for all layers simultaneously and allows only certain discrete values to be selected.
aPathSESs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetPathCurrentSESs and sonetPathIntervalSESs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify as unavailable seconds. In addition, IEEE Std 802.3 includes PLM-P and LCD-P defects in the criteria for declaring path layer severely errored seconds, while IETF RFC 3592 does not.
aPathESs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetPathCurrentESs and sonetPathIntervalESs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify as unavailable seconds. In addition, IEEE Std 802.3 includes PLM-P and LCD-P defects in the criteria for declaring path layer errored seconds, while IETF RFC 3592 does not
aPathCVs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetPathCurrentCVs and sonetPathIntervalCVs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify either as severely errored seconds or as unavailable seconds

Table 12–3—IEEE 802.3 managed object and SNMP object differences *(continued)*

IEEE 802.3 managed object	How corresponding SNMP object differs
aFarEndPathSESs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetFarEndPathCurrentSESs and sonetFarEndPathIntervalSESs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify as unavailable seconds. In addition, IEEE Std 802.3 includes far-end PLM-P and LCD-P defects in the criteria for declaring far-end path layer severely errored seconds, while IETF RFC 3592 does not.
aFarEndPathESs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetFarEndPathCurrentESs and sonetFarEndPathIntervalESs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify as unavailable seconds. In addition, IEEE Std 802.3 includes far-end PLM-P and LCD-P defects in the criteria for declaring far-end path layer errored seconds, while IETF RFC 3592 does not.
aFarEndPathCVs	This object is defined as a generalized nonresettable counter in IEEE Std 802.3, and it is not subject to inhibiting. The objects sonetFarEndPathCurrentCVs and sonetFarEndPathIntervalCVs are 15-minute interval counters, and they are inhibited (not incremented) during one-second intervals that qualify either as severely errored seconds or as unavailable seconds.

12.1.7 Mapping of SNMP objects to WIS station management registers

Some of the objects defined in this clause or incorporated by reference from the SONET-MIB IETF RFC 3592, or the MAU-MIB module defined in Clause 13 require WIS-specific hardware support. 50.3.11 of IEEE Std 802.3 specifies WIS management interface requirements, including a required subset of the WIS Management Data Input/Output (MDIO) registers defined in 45.2.2 of IEEE Std 802.3. Table 12–4 provides a cross- reference between those managed objects and the WIS MDIO registers from the subset in 50.3.11 of IEEE Std 802.3 required to support them. Note that the MDIO interface is optional; however, if it is not implemented, then the capabilities of the required register subset shall be provided by other means.

Table 12–4—Cross reference between SNMP objects and WIS MDIO registers

SMNP object	WIS MDIO register(s)
ETHER-WIS - etherWisDeviceTxTestPatternMode	10G WIS control 2

MAU-MIB - ifMauTypeListBits	10G WIS status 2

12.1.8 Structure of the MIB module

Four tables are defined in this MIB module.

12.1.8.1 etherWisDeviceTable

The purpose of this table is to define managed objects to control the WIS test pattern mode. These objects are required to support mandatory and optional WIS test features specified in 50.3.8 of IEEE Std 802.3.

The etherWisDeviceTable is a sparse augmentation of the sonetMediumTable of the SONET-MIB; in other words, for each entry in the etherWisDeviceTable there shall be an entry in the sonetMediumTable and the same ifIndex value shall be used for both entries.

12.1.8.2 etherWisSectionCurrentTable

The purpose of this table is to define managed objects for the transmitted and received section trace messages (J0 byte).

The etherWisSectionCurrentTable is a sparse augmentation of the sonetSectionCurrentTable of the SONET-MIB; in other words, for each entry in the etherWisSectionCurrentTable there shall be an entry in the sonetSectionCurrentTable and the same ifIndex value shall be used for both entries.

12.1.8.3 etherWisPathCurrentTable

The purpose of this table is to define managed objects for the current WIS path layer status and for the transmitted and received path trace messages (J1 byte). The path layer status object is provided because the WIS supports some near-end path status conditions that are not reported in sonetPathCurrentStatus.

The etherWisPathCurrentTable is a sparse augmentation of the sonetPathCurrentTable of the SONET-MIB; in other words, for each entry in the etherWisPathCurrentTable there shall be an entry in the sonetPathCurrentTable and the same ifIndex value shall be used for both entries.

12.1.8.4 etherWisFarEndPathCurrentTable

The purpose of this table is to define a managed object for the current status of the far end of the path. This object is provided because the WIS supports some far-end path status conditions that are not reported in sonetPathCurrentStatus.

The etherWisFarEndPathCurrentTable is a sparse augmentation of the sonetFarEndPathCurrentTable of the SONET-MIB; in other words, for each entry in the etherWisFarEndPathCurrentTable there shall be an entry in the sonetFarEndPathCurrentTable and the same ifIndex value shall be used for both entries.

12.2 Security considerations for Ethernet wide area network (WAN) interface sublayer (WIS) MIB module

There are five managed objects defined in this MIB module that have a MAX-ACCESS clause of read-write: etherWisDeviceTxTestPatternMode, etherWisDeviceRxTestPatternMode, etherWisDeviceRx-TestPatternErrors, etherWisSectionCurrentJ0Transmitted, and etherWisPathCurrentJ1Transmitted. Writing to these objects can have the following potentially disruptive effects on network operation:

— Changing the transmit or receive test pattern mode or modifying the accumulated error count from a PRBS31 pattern test on an administratively disabled 10GBASE-W interface, which can interfere with an in-progress pattern test.
— Modifying the transmitted section trace and/or path trace message on an operational 10GBASE-W interface, which can cause connectivity alarms to be raised at the remote of the link.

The user of this MIB module should therefore be aware that support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

The readable objects in this MIB module (i.e., those with MAX-ACCESS other than not-accessible) may be considered sensitive in some environments since, collectively, they provide information about the performance of network interfaces and can reveal some aspects of their configuration. In such environments it is

important to control GET and NOTIFY access to these objects and possibly to encrypt their values when sending them over the network via SNMP.

12.3 MIB module definition

An ASCII text version of the MIB definition can be found at the following URL:[19]

http://www.ieee802.org/3/be/public/mib_modules/20110202/802dot3dot1C12mib.txt

DESCRIPTION
        "The objects in this MIB module are used in conjunction
        with objects in the SONET-MIB module and the MAU-MIB module to manage
        the Ethernet WAN Interface Sublayer (WIS) defined in
        IEEE Std 802.3.

        Of particular interest are Clause 50, 'WAN Interface
        Sublayer (WIS), type 10GBASE-W', Clause 30, '10 Mb/s,
        100 Mb/s, 1000 Mb/s, and 10 Gb/s Management, and Link
        Aggregation Management', and Clause 45, 'Management
        Data Input/Output (MDIO) Interface'."

                    etherWisPathLCD(3)
                }
        MAX-ACCESS  read-only
        STATUS   current
        DESCRIPTION
           "This variable indicates the current status of the
           path payload with a bit map that can indicate multiple
           defects at once. The bit positions are assigned as
           follows:

           etherWisPathLOP(0)
              This bit is set to indicate that an
              LOP-P (Loss of Pointer - Path) defect
              is being experienced. When this
              bit is set, sonetPathSTSLOP shall be set
              in the corresponding instance of
              sonetPathCurrentStatus.
```

```
        etherWisPathAIS(1)
           This bit is set to indicate that an
           AIS-P (Alarm Indication Signal - Path)
           defect is being experienced. When
           this bit is set, sonetPathSTSAIS shall be
           set in the corresponding instance of
           sonetPathCurrentStatus.

        etherWisPathPLM(1)
           This bit is set to indicate that a
           PLM-P (Payload Label Mismatch - Path)
           defect is being experienced. When
           this bit is set, sonetPathSignalLabelMismatch
           shall be set in the corresponding instance of
           sonetPathCurrentStatus.
        etherWisPathLCD(3)
           This bit is set to indicate that an
           LCD-P (Loss of Codegroup Delination - Path)
           defect is being experienced. Since this
           defect is detected by the PCS and not by
           the path layer itself, there is no
           corresponding bit in sonetPathCurrentStatus."

Annex 12A

(informative)

Collection of performance data using WIS MDIO registers

The purpose of this annex is to illustrate how the WIS MDIO registers specified in IEEE Std 802.345.2.2 (and more specifically the subset required by IEEE Std 802.3 50.3.11) can be used to collect performance data either according to the conventions adopted by this document or according to the conventions specified in IEEE Std 802.3 Clause 30.

For an agent implementing the SNMP managed objects required by this document, the first step in collecting WIS performance data would be to poll the 10G WIS status 3 register and the various error count registers (10G WIS section BIP error count, 10G WIS line BIP errors, 10G WIS far end line BIP errors, 10G WIS path block error count, and 10G WIS far end path block error count) once per second. The 10G WIS status 3 register bits are all latched until read and so would indicate whether a given defect occurred any time during the previous second. The error count registers roll over modulo 2^{16} or 2^{32}, and so to find the number of errors within the previous second the agent would need to subtract (modulo 2^{16} or 2^{32}) the current reading from the reading taken one second ago. Armed with that information, the agent could determine for any layer whether the one second interval was an errored second, a severely errored second (that requires comparison with a threshold unless a defect is present), or a severely errored frame second. Determining whether a given second is or is not part of unavailable time requires additional logic; the most straightforward and accurate method is the delay-line approach outlined in Appendix A of IETF RFC 3592. With that information available the agent would be able to determine by how much each current count should be incremented (including effects of inhibiting). Implementations that conform to ANSI T1.231-1997 would end each 15-minute interval on time-of-day clock 1/4 hour boundaries; if the delay-line approach is used, then a time-of-day timestamp would accompany the one-second statistics. At the end of each interval, the current registers would be pushed onto the history stack and then would be cleared. The xyxIntervalValidData flags would be set to False(2) if the number of samples was not between 890 and 910 or, in the case of far-end counts, if a near-end defect occurred during the just-completed interval (see ANSI T1.231-1997 Section 9.1.2.2 for details).

An agent implementing the IEEE Std 802.3 Clause 30 oWIS objects could also start by polling the 10G WIS status 3 register and the various error count registers to find the defects and error counts for the previous second, and it could determine the number of errors and whether the second was an errored second, a severely errored second, or a severely errored frame second in the same manner as above. The rest of the process would simply be to increment the generalized non-resettable counters without consideration of any inhibiting rules.

13. Ethernet medium attachment units (MAUs) MIB module

13.1 Introduction

This clause defines a portion of the Management Information Base (MIB) for use with SNMP. In particular, it defines objects for managing IEEE 802.3 medium attachment units (MAUs).

A previous version of this clause, IETF RFC 3636, defined a single MIB module. IETF RFC 4836 split the original MIB module into two, putting frequently updated object identities and textual conventions into a separate, IANA-maintained MIB module, in order to decrease the need of updating the basic MAU-MIB module. The MIB module defined in this clause incorporates the IANA-MAU-MIB module by reference.

13.2 Overview

Instances of these object types represent attributes of an IEEE 802.3 MAU. Several types of MAUs are defined in IEEE Std 802.3. These MAUs may be connected to IEEE 802.3 repeaters or to IEEE 802.3 (Ethernet-like) interfaces. For convenience, this clause refers to these devices as "repeater MAUs" and "interface MAUs."

The definitions presented here are based on 30.5 and 30.6 of IEEE Std 802.3. This specification is intended to provide for management of all types of Ethernet/IEEE 802.3 MAUs.

13.2.1 Relationship to IETF RFC 3636 and IETF RFC 4836

The management definitions provided in this clause are intended to be a superset of those defined by IETF RFC 3636 and IETF RFC 4836.

In order to decrease the need of updating the basic MAU MIB module due to the new MAU type, Media Available state, Auto Negotiation capability and/or Jack type introduction, all relevant object identities and textual conventions have been moved to a separate, IANA-maintained MIB module, IANA-MAU-MIB. Thus when a new MAU type, Media Available state, Auto Negotiation capability, and/or Jack type is defined by the IEEE 802.3 working group, only the IANA-maintained module needs to be revised, leaving the basic MAU-MIB module defined in this clause unchanged.

The changes made in this revision are not entirely backward-compatible with MIB modules that currently import MAU type object identity descriptors from the MAU-MIB; such modules need to be revised to import those DESCRIPTORS from the IANA-MAU-MIB. Similarly, any management applications that process the object identity definitions (e.g., to present the DESCRIPTION text to a user) need to get those definitions from the IANA-MAU-MIB instead of the MAU-MIB. While it is true that changes that require such adjustments are not strictly compliant with the SMIv2 rules governing MIB module revisions (see IETF STD 58, RFC 2578 Section 10), in this case continued high maintenance costs that would result from not making these changes make the deviation from the rules justified.

13.2.2 Relationship to other MIBs

It is assumed that an agent implementing the MAU-MIB module will also implement (at least) the 'system' group defined in the SNMPv2 MIB of IETF RFC 3418. The following subclauses identify other MIBs that such an agent should implement.

13.2.2.1 Relationship to the Interfaces Group MIB

The subclauses of this clause that define interface MAU-related objects specify an extension to the Interfaces Group MIB of IETF RFC 2863. An agent implementing these interface-MAU related objects shall also implement the relevant groups of the ifCompliance3 MODULE-COMPLIANCE statement of the Interfaces Group MIB. The value of the object ifMauIfIndex is the same as the value of 'ifIndex' used to instantiate the interface to which the given MAU is connected.

An agent implementing the interface-MAU related objects in the MAU-MIB module shall also fully comply with the dot3Compliance2 MODULE-COMPLIANCE statement of the Ethernet-like interface MIB defined in Clause 10. Furthermore, when the interface-MAU related objects are used to manage a 10GBASE-W PHY—i.e., when ifMauType is equal to dot3MauType10GigBaseW or any other 10GBASE-W variant— then the agent shall also support the Ethernet WAN Interface Sublayer (WIS) MIB module defined in Clause 12, and shall follow the interface layering model specified therein. In that case the value of the object ifMauIfIndex is the same as the value of 'ifIndex' for the layer at the top of the stack, i.e., for the ifTable entry that has 'ifType' equal to ethernetCsmacd(6). If the interface-MAU related objects are used to manage a PHY that allows the MAU type to be changed dynamically, then the agent shall create ifTable, ifStackTable, and ifInvStackTable entries that pertain to the WIS when ifMauDefaultType is changed to a 10GBASEW variant (i.e., one of dot3MauType10GigBaseW, dot3MauType10GigBaseEW, dot3MauType10GigBaseLW, or dot3MauType10GigBaseSW) from any other type, and shall destroy the WIS-related entries when ifMauDefaultType is changed to a non-10GBASE-W type. The agent shall also change the values of 'ifConnectorPresent' and 'ifHighSpeed' in the ifTable entry indexed by ifMauIfIndex as specified in Clause 10 and Clause 12 when ifMauDefaultType is manipulated in this way, but shall NOT otherwise alter that entry.

NOTE—Repeater ports are not represented as interfaces in the Interfaces Group MIB.

13.2.2.2 Relationship to the IEEE 802.3 repeater MIB module

The subclause of this clause that defines repeater MAU-related objects specifies an extension to the IEEE 802.3 repeater MIB module defined in Clause 7. An agent implementing these repeater-MAU related objects shall also comply with the snmpRptrModCompl compliance statement of the IEEE 802.3 repeater MIB module.

The values of 'rpMauGroupIndex' and 'rpMauPortIndex' used to instantiate a repeater MAU variable shall be the same as the values of 'rptrPortGroupIndex' and 'rptrPortIndex' used to instantiate the port to which the given MAU is connected.

13.2.3 Management of internal MAUs

In some situations, a MAU can be "internal", i.e., its functionality is implemented entirely within a device. For example, a managed repeater may contain an internal repeater-MAU and/or an internal interface-MAU through which management communications originating on one of the repeater's external ports pass, in order to reach the management agent associated with the repeater. Such internal MAUs may or may not be managed. If they are managed, objects describing their attributes should appear in the appropriate MIB subtree: dot3RpMauBasicGroup for internal repeater-MAUs and dot3IfMauBasicGroup for internal interface-MAUs.

13.2.4 Mapping of IEEE 802.3 managed objects

Table 13–1 depicts the mapping between relevant managed objects (attributes) defined in IEEE Std 802.3 Clause 30, and managed objects defined in this clause.

Table 13–1—Mapping of IEEE 802.3 managed objects

IEEE 802.3 managed object		Corresponding SNMP object
oMAU	.aMAUID	rpMauIndex or ifMauIndex or broadMauIndex
	.aMAUType	rpMauType or ifMauType
	.aMAUTypeList	ifMauTypeListBits
	.aMediaAvailable	rpMauMediaAvailable or ifMauMediaAvailable
	.aLoseMediaCounter	rpMauMediaAvailableStateExits or ifMauMediaAvailableStateExits
	.aJabber	rpMauJabberState and rpMauJabberingStateEnters or ifMauJabberState and ifMauJabberingStateEnters
	.aMAUAdminState	rpMauStatus or ifMauStatus
	.aFalseCarriers	rpMauFalseCarriers or ifMauFalseCarriers
	.acResetMAU	rpMauStatus or ifMauStatus
	.acMAUAdminControl	rpMauStatus or ifMauStatus
	.nJabber	rpMauJabberTrap or ifMauJabberTrap
oAutoNegotiation	.aAutoNegID	ifMauIndex
	.aAutoNegAdminState	ifMauAutoNegAdminStatus
	.aAutoNegRemoteSignalling	ifMauAutoNegRemoteSignalling
	.aAutoNegAutoConfig	ifMauAutoNegConfig
	.aAutoNegLocalTechnologyAbility	ifMauAutoNegCapabilityBits
	.aAutoNegAdvertisedTechnologyAbility	ifMauAutoNegAdvertisedBits and ifMauAutoNegRemoteFaultAdvertised
	.aAutoNegReceivedTechnologyAbility	ifMauAutoNegReceivedBits and ifMauAutoNegRemoteFaultReceived
	.acAutoNegRestartAutoConfig	ifMauAutoNegRestart
	.acAutoNegAdminControl	ifMauAutoNegAdminStatus

Table 13–2 depicts the IEEE 802.3 managed objects that have not been included in the MAU-MIB module, and the reason for the exclusion.

Table 13–2—Unmapped IEEE 802.3 managed objects

IEEE 802.3 managed object		Reason for exclusion
oMAU	.aIdleErrorCount	Only useful for 100BaseT2, which is not widely implemented
oAutoNegotiation	.aAutoNegLocalSeletorAbility	Only needed for support of isoethernet (IEEE 802.9a), which is not supported by MAU-MIB
	.aAutoNegAdvertisedSelectorAbility	
	.aAutoNegReceivedSelectorAbility	

13.2.5 Addition of new MAU types

13.2.5.1 dot3MauType OBJECT-IDENTITIES

The dot3MauType OBJECT IDENTIFIER and its OBJECT-IDENTITY definitions has been moved from the MAU-MIB module into the IANA-maintained IANA-MAU-MIB module.

When a new IEEE 802.3 MAU is defined, IANA can re-issue a version of IANA-MAU-MIB module with the new dot3MauType OBJECT-IDENTITY and its matching IANAifMauTypeListBits textual convention value and, possibly, with new IANAifMauMediaAvailable, IANAifMauAutoNegCapBits, and/or IANAif-JackType values.

An Expert Review, as defined in IETF RFC 2434, is required for the addition of the new MAU, Media Available states, Auto Negotiation capabilities, and/or Jack types.

In some cases, new MAU types may require additional managed objects or may have side effects on the behavior of existing managed objects. In such cases a standards-track specification (which may be a new document or a revision of this document) is also required. Any such document is required to note any special properties of the MAU types that it defines—for example, side effects on the ifStackTable as noted in this document for 10GBASE-W MAUs.

13.2.5.2 IANAifMauTypeListBits TEXTUAL-CONVENTION

The syntax of ifMauTypeListBits is changed to be a textual convention, such that the enumerated integer values are now defined in the textual convention IANAifMauTypeListBits, which can be re-specified (with additional values, when defined by IEEE 802.3) in the IANA-maintained MIB module without issuing a new version of this document.

13.2.5.3 IANAifMauMediaAvailable TEXTUAL-CONVENTION

The syntax of ifMauMediaAvailable and rpMauMediaAvailable is changed to be a textual convention, such that the enumerated integer values are now defined in the textual convention IANAifMauMediaAvailable, which can be re-specified (with additional values, when defined by IEEE 802.3) in the IANA-maintained MIB module without issuing a new version of this document.

13.2.5.4 IANAifMauAutoNegCapBits TEXTUAL-CONVENTION

The syntax of ifMauAutoNegCapabilityBits, ifMauAutoNegCapAdvertisedBits, and ifMauAutoNegCapRe-ceivedBits objects is changed to be a textual convention, such that the enumerated integer values are now defined in the textual convention IANAifMauAutoNegCapBits, which can be re-specified (with additional

values, when defined by IEEE 802.3) in the IANA-maintained MIB module without issuing a new version of this document.

13.2.5.5 JackType TEXTUAL-CONVENTION

The JackType Textual Convention has been deprecated in favor of the IANAifJackType defined in the IANA-maintained MIB module, so the new Jack types can be added (when defined by IEEE 802.3) without issuing a new version of this document.

13.3 Security considerations for Ethernet medium attachment units (MAUs) MIB module

The IANA-MAU-MIB module does not define any management objects. Instead, it defines a set of textual conventions that are used by the MAU-MIB module and may be used by other MIB modules to define management objects. Meaningful security considerations can only be written for MIB modules that define management objects.

There are a number of management objects defined in the MAU-MIB module that have a MAX-ACCESS clause of read-write. Setting these objects can have a serious effect on the operation of the network, including:

— Enabling or disabling a MAU
— Changing a MAU's default type
— Enabling, disabling, or restarting autonegotiation
— Modifying the capabilities that a MAU advertises during autonegotiation.

Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

Some of the readable objects in the MAU-MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. In some environments, it may be undesirable to allow unauthorized parties to access statistics or status information about individual links in a network. It is thus important to control GET and/or NOTIFY access to these objects and possibly to encrypt the values of these objects when sending them over the network via SNMP.

13.4 IANA considerations

It is intended that each new MAU type, Media Available state, Auto Negotiation capability, and/or Jack type defined by the IEEE 802.3 working group and approved for publication in a revision of IEEE Std 802.3 will be added to the IANA-maintained MIB module, provided that it is suitable for being managed by the base objects in the MAU-MIB module.

For each new MAU type added, a short description of the MAU technology and, wherever possible, a reference to a publicly available specification should be specified. An Expert Review, as defined in IETF RFC 2434, is required, for each modification.

13.5 MIB module definition

An ASCII text version of the MIB definition can be found at the following URL:[20]

http://www.ieee802.org/3/be/public/mib_modules/20110202/802dot3dot1C13mib.txt

The IANA-MAU-MIB module can be found at the following URL:

http://www.iana.org/assignments/ianamau-mib

              Note:  In practice, a group will generally be
              a field-replaceable unit (i.e., module, card,
              or board) that can fit in the physical system
              enclosure, and the group number will correspond
              to a number marked on the physical enclosure.

              The group denoted by a particular value of this
              object is the same as the group denoted by the
              same value of rptrGroupIndex."
  REFERENCE   "RFC 2108, rptrGroupIndex."

                             unknown(2),
                             operational(3),
                             standby(4),
                             shutdown(5),
                             reset(6)
                          }
            MAX-ACCESS   read-write
            STATUS       current
            DESCRIPTION  "The current state of the MAU. This object may
                         be implemented as a read-only object by those
                         agents and MAUs that do not implement software
                         control of the MAU state. Some agents may not
                         support setting the value of this object to some
                         of the enumerated values.

                         The value other(1) is returned if the MAU is in
                         a state other than one of the states 2 through
                         6.
                         The value unknown(2) is returned when the MAU's
                         true state is unknown; for example, when it is
```

                         being initialized.

                         A MAU in the operational(3) state is fully
                         functional; it operates, and passes signals to its
                         attached DTE or repeater port in accordance to
                         its specification.

                         A MAU in standby(4) state forces DI and CI to
                         idle, and the media transmitter to idle or fault,
                         if supported. Standby(4) mode only applies to
                         link type MAUs. The state of
                         rpMauMediaAvailable is unaffected.

                         A MAU in shutdown(5) state assumes the same
                         condition on DI, CI, and the media transmitter,
                         as though it were powered down or not connected.
                         The MAU may return other(1) value for the
                         rpMauJabberState and rpMauMediaAvailable objects
                         when it is in this state. For an AUI, this
                         state will remove power from the AUI.

                         Setting this variable to the value reset(6)
                         resets the MAU in the same manner as a
                         power-off, power-on cycle of at least one-half
                         second would. The agent is not required to
                         return the value reset(6).

                         Setting this variable to the value
                         operational(3), standby(4), or shutdown(5)
                         causes the MAU to assume the respective state,
                         except that setting a mixing-type MAU or an AUI
                         to standby(4) will cause the MAU to enter the
                         shutdown state."
         REFERENCE   "IEEE Std 802.3, 30.5.1.1.7, aMAUAdminState,

                OBJECT-IDENTITIES of dot3MauType.
                If the MAU type is unknown, the object identifier
                zeroDotZero is returned.

                This object represents the operational type of
                the MAU, as determined by either 1) the result
                of the Auto-Negotiation function or 2) if
                Auto-Negotiation is not enabled or is not
                implemented for this MAU, by the value of the
                object ifMauDefaultType. In case 2), a set to
                the object ifMauDefaultType will force the MAU
                into the new operating mode."
  REFERENCE   "IEEE Std 802.3, 30.5.1.1.2, aMAUType."
  ::= { ifMauEntry 3 }

ifMauStatus OBJECT-TYPE
    SYNTAX       INTEGER {
                    other(1),
                    unknown(2),
                    operational(3),
                    standby(4),
                    shutdown(5),
                    reset(6)
                 }
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION "The current state of the MAU. This object may
                be implemented as a read-only object by those
                agents and MAUs that do not implement software
                control of the MAU state. Some agents may not
                support setting the value of this object to some
                of the enumerated values.

                The value other(1) is returned if the MAU is in
```

a state other than one of the states 2 through
6.

The value unknown(2) is returned when the MAU's
true state is unknown; for example, when it is
being initialized.

A MAU in the operational(3) state is fully
functional; it operates, and passes signals to its
attached DTE or repeater port in accordance to
its specification.

A MAU in standby(4) state forces DI and CI to
idle and the media transmitter to idle or fault,
if supported. Standby(4) mode only applies to
link type MAUs. The state of
ifMauMediaAvailable is unaffected.

A MAU in shutdown(5) state assumes the same
condition on DI, CI, and the media transmitter,
as though it were powered down or not connected.
The MAU may return other(1) value for the
ifMauJabberState and ifMauMediaAvailable objects
when it is in this state. For an AUI, this
state will remove power from the AUI.

Setting this variable to the value reset(6)
resets the MAU in the same manner as a
power-off, power-on cycle of at least one-half
second would. The agent is not required to
return the value reset(6).

Setting this variable to the value
operational(3), standby(4), or shutdown(5)
causes the MAU to assume the respective state,
except that setting a mixing-type MAU or an AUI
to standby(4) will cause the MAU to enter the
shutdown state."

        STATUS      current
```

```
        DESCRIPTION "A count of the number of false carrier events
                    during IDLE in 100BASE-X and 1000BASE-X links.

                    For all other MAU types, this counter will
                    always indicate zero. This counter does not
                    increment at the symbol rate.

                    It can increment after a valid carrier
                    completion at a maximum rate of once per 100 ms
                    for 100BASE-X and once per 10us for 1000BASE-X
                    until the next CarrierEvent.

                    This counter can roll over very quickly. A
                    management station is advised to poll the
                    ifMauHCFalseCarriers instead of this counter in
                    order to avoid loss of information.

                    Discontinuities in the value of this counter can
                    occur at re-initialization of the management
                    system and at other times, as indicated by the
                    value of ifCounterDiscontinuityTime."
        REFERENCE   "IEEE Std 802.3, 30.5.1.1.10, aFalseCarriers.
                    RFC 2863, ifCounterDiscontinuityTime."
        ::= { ifMauEntry 9 }

    ifMauDefaultType OBJECT-TYPE
        SYNTAX      AutonomousType
        MAX-ACCESS  read-write
        STATUS      current
        DESCRIPTION "This object identifies the default
                    administrative baseband MAU type to be used in
                    conjunction with the operational MAU type
                    denoted by ifMauType.

                    The set of possible values for this object is
                    the same as the set defined for the ifMauType
                    object.

                    This object represents the
                    administratively-configured type of the MAU. If
                    Auto-Negotiation is not enabled or is not
                    implemented for this MAU, the value of this
                    object determines the operational type of the
                    MAU. In this case, a set to this object will
                    force the MAU into the specified operating mode.

                    If Auto-Negotiation is implemented and enabled
                    for this MAU, the operational type of the MAU
                    is determined by Auto-Negotiation, and the value
                    of this object denotes the type to which the MAU
                    will automatically revert if/when
                    Auto-Negotiation is later disabled.

                    It may be necessary to provide for underlying hardware
                    implementations which do not follow the exact behavior
                    specified above.
                    In particular, when ifMauAutoNegAdminStatus transitions
                    from enabled to disabled, the agent implementation shall
                    ensure that the operational type of the MAU
```

```
                    (as reported by ifMauType) correctly transitions to
                    the value specified by this object, rather than
                    continuing to operate at the value earlier
                    determined by the Auto-Negotiation function."
        REFERENCE   "IEEE Std 802.3, 30.5.1.1.1, aMAUID, and 22.2.4.1.4."

-- Placeholder to preserve module structure and assignments
dot3Placeholder OBJECT-TYPE
    SYNTAX      INTEGER {
                    placeholder(1)
                }
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION "A placeholder object to preserve the assignments
                 that follow in the module. The assignment was given
                 to the object broadMauBasicTable in earlier
                 versions of this module. Preserving the assignments that
                 follow is considered important because they are used for
                 the IANA-MAU-MIB to assign as MAU type values."
    REFERENCE   "none"
    ::= { dot3PlaceholderGroup 1 }

Annex B

(normative)

GDMO specification for IEEE 802.3 managed object classes

This annex formally defines the protocol encodings for CMIP and ISO/IEC 15802-2:1995 [IEEE Std 802.1B and IEEE Std 802.1k, 1995 Edition] for the IEEE 802.3 managed objects using the templates specified in ISO/IEC 10165-4:1992. The application of a GDMO template compiler against B.1 to B.18 will produce the proper protocol encodings.

NOTE 1—The arcs (that is, object identifier values) defined in this annex deprecate the arcs previously defined in Annexes H.1 (Layer Management), H.2 (Repeater Management), and H.3 (MAU Management). See IEEE Std 802.1F-1993, Annex C.4.

NOTE 2—During the update for IEEE Std 802.3-2005, differences between objects in the root of all registration arcs were harmonized and aligned with the recommendation of IEEE Std 802b-2004. All instances were changed to *{iso(1) std(0) iso8802(8802) csma(3)...* For maximum compatibility with previous implementations it is recommended that all implementations respond equally to requests for communication based on registration arc *{iso(1) member-body(2) us(840) ieee802dot3(10006)...*

NOTE 3—The arcs defined in this annex have not been updated to conform to the currently preferred root of "org ieee(111) standards-association-numbers-series-standards(2) lan-man-stds(802) ieee802dot3(3)" because the GDMO object definitions are of historical value only, and are not recommended for current or future implementations.

Each attribute definition in this clause references directly by means of the WITH ATTRIBUTE SYNTAX construct or indirectly by means of the DERIVED FROM construct an ASN.1 type or subtype that defines the attribute's type and range. Those ASN.1 types and subtypes defined exclusively for CSMA/CD Management appear in a single ASN.1 module in C.2.

Counters for these protocol encodings are specified as either 32 or 64 bits wide. Thirty-two bit counters are used for the protocol encoding of counter attributes, providing the minimum rollover time is 58 min or more. Sixty-four bit counters are used for the protocol encoding of counter attributes that could roll over in less than 58 min with a 32-bit counter. Approximate counter rollover times are provided as notes below each counter BEHAVIOUR definition. 10 Gb/s counters are 10 times faster than 1000 Mb/s counters, 1000 Mb/s counters are 10 times faster than 100 Mb/s counters, and 100 Mb/s counters are 10 times faster than 10 Mb/s counters. For a formal definition of the counter, refer to the BEHAVIOUR bCMCounter in C.2.

aMACID   **ATTRIBUTE**

  WITH ATTRIBUTE SYNTAX IEEE802Dot3-MgmtAttributeModule.OneOfName;
  MATCHES FOR   EQUALITY;
  BEHAVIOUR   bMACID;
  REGISTERED AS {iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7) macID(1)};

bMACID   **BEHAVIOUR**

  DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.1;

aFramesTransmittedOK   **ATTRIBUTE**

  DERIVED FROM   aCMCounter;
  BEHAVIOUR   bFramesTransmittedOK;
  REGISTERED AS {iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7) framesTransmittedOK(2)};

bFramesTransmittedOK   **BEHAVIOUR**

  DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.2

    NOTE 1—The approximate minimum time between counter rollovers for 10 Mb/s operation is 80 h.

    NOTE 2—This maps to framesSent (of the mandatory macPackage) in ISO/IEC 10742:1994.;

aSingleCollisionFrames   **ATTRIBUTE**

  DERIVED FROM   aCMCounter;
  BEHAVIOUR   bSingleCollisionFrames;
  REGISTERED AS {iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7) singleCollisionFrames(3)};

bSingleCollisionFrames   **BEHAVIOUR**

    DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.3

                     NOTE—The approximate minimum time between counter rollovers for 10 Mb/s operation is 103 h.;

aMultipleCollisionFrames   **ATTRIBUTE**

    DERIVED FROM   aCMCounter;
    BEHAVIOUR   bMultipleCollisionFrames;
    REGISTERED AS   {iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7) multipleCollisionFrames(4)};

bMultipleCollisionFrames   **BEHAVIOUR**

    DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.4

                     NOTE—The approximate minimum time between counter rollovers for 10 Mb/s operation is 125 h.;

aFramesReceivedOK   **ATTRIBUTE**

    DERIVED FROM   aCMCounter;
    BEHAVIOUR   bFramesReceivedOK;
    REGISTERED AS   {iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7) framesReceivedOK(5)};

bFramesReceivedOK   **BEHAVIOUR**

    DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.5

                     NOTE 1—The approximate minimum time between counter rollovers for 10 Mb/s operation is 80 h.

                     NOTE 2—This maps to framesReceived (of the mandatory macPackage) in ISO/IEC 10742:1994.;

aFrameCheckSequenceErrors   **ATTRIBUTE**

    DERIVED FROM   aCMCounter;
    BEHAVIOUR   bFrameCheckSequenceErrors;
    REGISTERED AS   {iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7) frameCheckSequenceErrors(6)};

bFrameCheckSequenceErrors   **BEHAVIOUR**

    DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.6

                     NOTE—The approximate minimum time between counter rollovers for 10 Mb/s operation is 80 h.;

aAlignmentErrors   **ATTRIBUTE**

    DERIVED FROM   aCMCounter;

BEHAVIOUR	bAlignmentErrors;
REGISTERED AS	{iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7) alignmentErrors(7)};

bAlignmentErrors   **BEHAVIOUR**

DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.7

NOTE—The approximate minimum time between counter rollovers for 10 Mb/s operation is 80 h.;

aOctetsTransmittedOK   **ATTRIBUTE**

DERIVED FROM	aCMCounter;
BEHAVIOUR	bOctetsTransmittedOK;
REGISTERED AS	{iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7) octetsTransmittedOK(8)};

bOctetsTransmittedOK   **BEHAVIOUR**

DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.8

NOTE 1—The approximate minimum time between counter rollovers for 10 Mb/s operation is 58 min.

NOTE 2—This maps to octetsSent (of the mandatory macPackage) in ISO/IEC 10742:1994.;

aFramesWithDeferredXmissions   **ATTRIBUTE**

DERIVED FROM	aCMCounter;
BEHAVIOUR	bFramesWithDeferredXmissions;
REGISTERED AS	{iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7) framesWithDeferredXmissions(9)};

bFramesWithDeferredXmissions   **BEHAVIOUR**

DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.9

NOTE—The approximate minimum time between counter rollovers for 10 Mb/s operation is 103 h.;

aLateCollisions   **ATTRIBUTE**

DERIVED FROM	aCMCounter;
BEHAVIOUR	bLateCollisions;
REGISTERED AS	{iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7) lateCollisions(10)};

bLateCollisions   **BEHAVIOUR**

DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.10

NOTE—The approximate minimum time between counter rollovers for 10 Mb/s operation is 80 h.;

aFramesAbortedDueToXSColls   **ATTRIBUTE**

    DERIVED FROM   aCMCounter;
    BEHAVIOUR   bFramesAbortedDueToXSColls;
    REGISTERED AS   {iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7)
    framesAbortedDueToXSColls(11)};

bFramesAbortedDueToXSColls   **BEHAVIOUR**

    DEFINED AS   See "BEHAVIOUR DEFINED AS" in IEEE Std 802.3 30.3.1.1.11

    NOTE—The approximate minimum time between counter rollovers for 10 Mb/s
    operation is 53 days.;

B.10 ResourceTypeID managed object class

B.10.1 ResourceTypeID, formal definition

-- Implementation of this managed object in accordance with the definition contained in IEEE Std
-- 802.1F-1993 is a conformance requirement of this standard.
-- NOTE—A single instance of the Resource Type ID managed object exists within the oMACEntity
-- managed object class, a single instance of the Resource Type ID managed object exists within
-- the oRepeater managed object class, and a single instance of the Resource Type ID managed
-- object exists within the oMAU managed object class conditional on the presence of an MII.
-- The managed object itself is contained in IEEE Std 802.1F-1993, therefore only name bindings
-- appear in this standard;

Annex C

(normative)

GDMO and ASN.1 definitions for management

C.1 Common attributes template

This template defines generic facilities that are used in the standard.

aCMCounter   **ATTRIBUTE**

  DERIVED FROM   "ISO/IEC 10165-5":genericWrappingCounter;
  BEHAVIOUR   bCMCounter;
  REGISTERED AS   {iso(1) std(0) iso8802(8802) csma(3) csmacdmgt(30) attribute(7)
  cmCounter(88)};

bCMCounter   **BEHAVIOUR**

  DEFINED AS   Wraps at one of two sizes. Size is conditional.

          Wraps at 32 bits, that is this counter reaches its maximum value at $2^{32}-1$
          (i.e., approximately 4.294×10^9) and then rolls over to zero on the next
          increment, if maximum increment rate from zero causes a rollover in
          58 min or more.

          Wraps at 64 bits, that is this counter reaches its maximum value at $2^{64}-1$
          (i.e., approximately 1.844×10^{19}) and then rolls over to zero on the next
          increment, if maximum increment rate from zero would cause a 32 bit
          counter to roll over in less than 58 min.
          The counter that this is derived from initializes to zero. Initialization to
          zero is not a requirement of this standard;

C.2 ASN.1 module for CSMA/CD managed objects

This ASN.1 module defines the ASN.1 types and subtypes that are referred to immediately after the WITH ATTRIBUTE SYNTAX construct in this clause uses of the attribute template defined in ISO/IEC 10165-4:1992 [B37].

영문표준 해설서

1. 개요

본 표준인 이더넷 관리 정보 베이스 (MIB)에 대한 개요, 범주, 목적, 인터넷 표준 관리 프레임워크 (IETF RFC 3410), 보안 고려 사항, 적합성 등을 기술한다.

2. 규정 참고 문헌

본 표준의 참고 문헌을 기술한다.

3. 정의

본 표준에서 사용하는 용어 정의를 기술한다.

4. 약어

본 표준에서 사용하는 약어를 기술한다.

5. 이더넷 LLDP (Logical Link Discovery Protocol) 확장 MIB 모듈

이더넷 논리 링크 탐색 프로토콜 (IEEE Std 802.1AB-2009) 확장을 관리하기 위한 대한 MIB 구조, 다른 MIB 모듈들과의 관계, 보안 고려 사항, MIB 모듈 정의 등을 기술한다.

6. 이더넷 OAM (Operations, Administration, Maintenance) MIB 모듈

이더넷 OAM (단일-홉 링크 OAM; remote fault indication, link monitoring, remote loopback)를 관리하기 위한 MIB 구조, 다른 MIB 모듈들과의 관계, 토폴로지 매핑, MIB 모듈 정의 등을 기술한다.

7. 이더넷 리피터 장치 MIB 모듈

IEEE 802.3 리피터를 관리하기 위한 MIB 구조, 다른 MIB 모듈들과의 관계, 토폴로지 매핑 (IETF RFC 2108 Section 4), MIB 모듈 정의 등을 기술한다.

8. MDI (Media Dependent Interface)를 통한 이더넷 DTE (Data Terminal Equipment) 전원 MIB 모듈

MDI 전력 공급 장치 (PSE; Power Sourcing Equipment)를 통한 전원을 관리하기 위한 MIB 구조, 보안 고려 사항, MIB 모듈 정의 등을 기술한다.

9. EPON (Ethernet Passive Optical Network) MIB 모듈

1G-EPON 인터페이스를 관리하기 위한 MIB 구조, 다른 MIB 모듈들과의 관계, IEEE 802.3 관리 객체와의 매핑, 보안 고려 사항, MIB 모듈 정의 등을 기술한다.

10. Ethernet-like 인터페이스 MIB 모듈

Ethernet-like 인터페이스를 관리하기 위한 MIB 구조, 다른 MIB 모듈들과의 관계, 보안 고려 사항, MIB 모듈 정의 등을 기술한다.

11. EFMCu (Ethernet in the First Mile copper) 인터페이스 MIB 모듈

EFMCu (음성 수준의 구리선을 사용하는 2BASE-TL, 10PASS-TS) 인터페이스를 관리하기 위한 MIB 구조, 다른 MIB 모듈들과의 관계, 보안 고려 사항, MIB 모듈 정의 등을 기술한다.

12. 이더넷 WIS (WAN Interface Sublayer) MIB 모듈

이더넷 WIS (10GBASE-SW/LW/EW 에 사용하는 WAN Interface Sublayer)를 관리하기 위한 MIB 구조, 다른 MIB 모듈들과의 관계, 보안 고려 사항, MIB 모듈 정의 등을 기술한다.

부속서 12A (정보) WIS MDIO 를 사용한 성능 데이터 수집

WIS 성능 데이터를 수집하기 위해 IEEE Std 802.3 45.2.2 에서 정의하고 있는 WIS MDIO 레지스터들을 어떻게 관리 객체로 매핑하여 사용할 수 있는지를 기술한다.

13. 이더넷 MAUs (Media Attachment Units) MIB 모듈

이더넷 MAU 를 관리하기 위한 MIB 구조, 다른 MIB 모듈들과의 관계, 보안 고려 사항, IANA 고려 사항, MIB 모듈 정의 등을 기술한다.

부속서 A (정보) 인용 문헌

본 표준의 인용 문헌을 기술한다.

부속서 B (규정) IEEE 802.3 관리 객체 클래스를 위한 관리 객체 정의 지침 (GDMO) 규격

IEEE 802.3 관리 객체에 대해 ISO/IEC 10165-4:1992 의 템플릿을 사용하여 CMIP (Common Management Information Protocol)와 ISO/IEC 15802-2:199 에 사용하기 위한 프로토콜 부호화를 기술한다.

부속서 C (규정) 관리를 위한 GDMO 및 ASN.1 정의

IEEE 802.3 관리 객체를 위한 관리 객체 정의 지침 (GDMO) 및 추상 구문 기법 (ASN.1)를 기술한다.
